Group No. 16: Oncology

ABEMACICLIB

Clue	Description	Indications	Route of administration and dosage
	TABLET Each tablet contains Abemaciclib	As initial treatment, in combination with an aromatase	Oral Adults:
010.000.6282.00	150 mg Container with 56 tablets	inhibitor as background endocrine therapy, for the initial treatment of menopausal women with hormone	150 mg 2 times a day This regimen is repeated until progression or treatment failure.
010.000.6283.00	Each tablet contains Abemaciclib 100mg Container with 56 tablets	receptor-positive (HR+) and human epidermal growth factor receptor 2- negative (HER2-) advanced or metastatic breast cancer.	Doses can be decreased to 100 mg or 50 mg based on individual safety and tolerability.
010.000.6284.00	Each tablet contains Abemaciclib 50 mg Container with 56 tablets	uleasi calicel	When Abemaciclib is administered in combination with non- steroidal aromatase inhibitors, the recommended dose of Letrozole is 2.5 mg daily or Anastrozole 1 mg daily.

Generalities

Abemaciclib is an inhibitor of cyclin-dependent kinases 4 and 6 (CDK4 and CDK6). These kinases are activated by binding to cyclins D. In estrogen receptor-positive (ER+) breast cancer cell lines, cyclin D1 and CDK4/6 promote phosphorylation of the retinoblastoma protein (Rb), cycle progression cell and cell proliferation. In vitro, continuous exposure to abemaciclib inhibited phosphorylation of the retinoblastoma protein (Rb), and blocked progression from G1 to the S phase of the cell cycle, causing senescence and apoptosis.

The following most common adverse events with the use of Abemaciclib are: diarrhea, neutropenia, nausea and fatigue, hepatotoxicity, and venous thromboembolism.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug or to the components of the formula, pregnancy and lactation. Precautions:

Diarrhea: Patients should be instructed that at the first sign of loose stools they should initiate antidiarrheal therapy, such as loperamide, increase oral fluids, and notify their healthcare provider in order to receive

additional instructions and appropriate follow-up.

For grade 3 or 4 diarrhea, or diarrhea requiring hospitalization, abemaciclib should be withheld until toxicity resolves to grade 1, and then resume abemaciclib at the next lower dose.

Hepatotoxicity: Monitor liver function tests (LFTs) prior to initiation of abemaciclib therapy given two weeks for the first two months, monthly for the next two months, and when clinically indicated. It is recommended to interrupt administration, reduce the dose, suspend administration or delay the start of therapeutic cycles in patients who develop persistent or recurrent elevation of hepatic transaminases grade 2, or grades 3 or 4.

Venous thromboembolism: Monitor patients for signs and symptoms of venous thrombosis and pulmonary embolism and treat as medically appropriate.

Interactions

Concomitant use of other strong CYP3A inhibitors (Itraconazole, Diltiazem, Verapamil, Rifampicin) requires reduction of the recommended doses. Coadministration of abemaciclib with rifampin, a potent CYP3A inducer, reduced plasma concentrations of abemaciclib plus its active metabolites and could result in reduced activity.

Avoid concomitant use of oral ketoconazole. Avoid grapefruit products

	TABLET	Treatment of patients	Oral.			

	Description	indicationic	Roule of autilitistration and dosage
010.000.6149.00	TABLET Each tablet contains: Afatinib dimaleate equivalent to 40.0 mg afatinib Package with 30 tablets.	Treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) presence of Epidermal Growth Receptor (EGFR) gene mutations in in the subgroup of patients with deletion 19.	Oral. Adults: 40 mg once a day. The dose may be decreased to 30 mg once daily based on individual tolerability.
•	t and selective irreversible blocker of th		
•		e ErbB family. Afatinib binds	

signaling of all homo- and heterodimers formed by the following members of the ErbB family: EGFR (ErbB1), HER 2 (ErbB2), ErbB3 and ErbB4.

Risk in Pregn	ancyd
	Adverse effects
Diarrhea, skin rash.	
	Contraindications and Precautions
Contraindications: Hypersensitivity to the d	lrug, children, adolescents and severe liver impairment.
	Interactions

The results of a drug interaction study demonstrated that Afatinib, since it is not metabolized by the liver (CYP450), can be safely combined with P-gp (P-glycoprotein) inhibitors as long as they are administered simultaneously with Afatinib or after this. Afatinib should be administered without food, with no food consumed for at least 3 hours before and at least after taking Afatinib.

CAPSULE First treatment Oral Each capsule contains: Alectinib hydrochloride 161.33 mg equivalent to positive advanced non-small Adults 010.000.6227.00 Collective box with 4 boxes with 56 150 Treatment for adult patients with Dose 600 mg (4 capsules of 150 mg), twice a day (total daily dose of 1200 mg). 010.000.6227.00 Collective box with 4 boxes with 56 150 Treatment for adult patients with ALX-positive advanced non-small cell lung cancer (NSCLC) previously treated with crizotinib. ALECTINIB (In prescription control program)

Generalities

Alectinib is a highly selective and potent inhibitor of the ALK and RET receptor tyrosine kinases. Both in vitro and in vivo, alectinib was shown to have activity against mutant forms of the ALK enzyme, including mutations responsible for crizotinib resistance.

Based on non-clinical data, alectinib is not a substrate of P-glycoprotein (P-gp) or breast cancer resistance protein (BCRP), efflux transporter proteins in the blood-brain barrier, so alectinib can be distributed and maintained in the central nervous system. Alectinib induced tumor regression in nonclinical mouse xenograft models, including antitumor activity in the brain, and prolonged survival in animal models of intracranial tumors.

Risk in Pregnancy c

Adverse effects

The most common adverse drug reactions (ÿ20%) were constipation (36%), edema (34%, including peripheral, generalized, periorbital, eyelid), myalgia (31%), nausea (22%), elevated bilirubin (21%). %), anemia (20%) and rash (20%).

Contraindications and Precautions

Alectinib is contraindicated in patients with known hypersensitivity to alectinib or any of the excipients. Do not administer during pregnancy and lactation. Cases of interstitial lung disease/pneumonitis have been reported in clinical trials with Alectinib. Patients should be monitored for pulmonary symptoms suggestive of pneumonitis. Elevations in the concentration of alanine aminotransferase (ALT) and aspartate aminotransferase (AST) have been recorded. Liver function (determination of ALT, AST and total bilirubin) should be evaluated before starting treatment and thereafter every 2 weeks during the first 3 months of treatment; periodically thereafter. Myalgia or musculoskeletal pain was reported in patients in the pivotal studies with Alectinib, including Grade 3 events. Recommend patients to report.

Interactions

No interactions have been identified to date.

AMIFOSTINE

ATEZQLIZUMAB (In prescription control program)

Ciue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Treatment of adult patients with non-small cell	Intravenous infusion.
		lung cancer after	
	Box with a vial contains:	and the second	Adults: The recommended dose of Atezolizumab is 1200 mg
	Atezolizumab 1200 mg	previous chemotherapy based on platinum, with advanced disease, negative for	every 3 weeks.
010.000.6193.00	Package with a vial with 1200 mg in 20 mL (1200 mg/20 mL).	EGFR or ALK, with positive PD-L1 biomarker (ÿ10%).	

Generalities

Atezolizumab is a humanized immunoglobulin monoclonal antibody that targets PD-L1 on tumor-infiltrating immune cells or tumor cells. Atezolizumab binds directly and selectively to PD-L1, thus preventing it from binding to its PO 1 and 87.1 receptors, which function as inhibitory receptors expressed on activated T lymphocytes and other tumor-infiltrating immune cells. Interference of interactions between PD-L1 and PD-1 and between PD-L1 and 87.1 may enhance the magnitude and quality of the tumor-specific T cell response through increased priming, expansion, or effector function.

Atezolizumab is designed to eliminate the effector function of Fc through a single amino acid substitution at position 298 of the heavy chain, resulting in a non-glycosylated antibody that has minimal binding to Fc receptors. This, in turn, eliminates detectable Fe effector function and cell-mediated antibody-dependent cytotoxicity so that antibody-mediated elimination of activated effector T cells is prevented.

Risk in pregnancy C	
l A	Adverse effects

In the clinical studies carried out with Atezolizumab the most serious adverse reactions were: Inflammation of the lung tissue (Pneumonitis related to the immune response). Inflammation of the lung tissue (Pneumonitis related to the immune response). Inflammation of the colon (Colitis related to the immune response). Diseases that affect the glands and hormones (hypothyroidism, hyperthyroidism, adrenal insufficiency, type 1 diabetes mellitus). Inflammation of the brain and its lining (immune-related meningoencephalitis). Diseases of the nervous system related to the defense system (myasthenic syndrome/myasthenia gravis, Guillain-8arré syndrome) Inflammation of the Pancreas (Pancreatitis related to the immune response) Inflammation of the kidneys (Nephritis related to the immune response).

Contraindications and Precautions

Atezolizumab is contraindicated in patients with known hypersensitivity to atezolizumab or any of the excipients. Do not administer during pregnancy and lactation. It is recommended in order to improve the traceability of biological medicines, the commercial name and batch number of the administered product must be clearly recorded (or indicated) in the patient's file.

No interaction has been identified to date.

AXITINIB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	TABLET	Second treatment Advanced Renal Cell Carcinoma	Oral.
	Each tablet contains:	(RaCC) line with failure to a	Adults:
	Axitinib 5 mg	tyrosine kinase inhibitor.	5 mg twice daily, with or without food.
010.000.6006.00	Package with 60 tablets.		Increase or reduce dosage based on individual safety
			and tolerability.

Generalities

Axitinib is a potent and selective inhibitor of vascular endothelial growth factor receptor (VEGFR)-1, VEGFR-2, and VEGFR-3 tyrosine kinases. These receptors participate in pathological angiogenesis, tumor growth, and metastatic progression of cancer. Axitinib has been shown to potently inhibit VEGF-mediated endothelial cell survival and proliferation.

Risk in Pregnancy	c	
	Adverse effects	-

Diarrhea, hypertension, fatigue, decreased appetite, nausea, dysphonia, palmo-plantar erythrodysesthesia syndrome (hand-foot syndrome), weight loss, vomiting, asthenia and constipation.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Hypertension, thyroid dysfunction, arterial thromboembolic events, venous thromboembolic events, hemorrhage, gastrointestinal perforation and fistula formation, complications in wound healing, syndrome

of reversible posterior leukoencephalopathy (RPLS), liver damage, effects on the ability to drive and use machinery.

Interactions

Medications that increase the plasma concentration of Axitinib: CYP3A4/5 inhibitors, such as Ketoconazole, Itraconazole, Clarithromycin, Atazanavir, Indinavir, Nefazodone, Nelfinavir, Ritonavir, Saquinavir, Telithromycin and grapefruit. If a strong CYP3A4/5 inhibitor must be co-administered, a dose adjustment of Axitinib is recommended. Medications that decrease the plasma concentration of Axitinib: CYP3A4/5 inducers such as: Rifampin, Dexamethasone, Phenytoin, Carbamazepine, Rifabutin, Rifapentin, Phenobarbital, and Hypericum perforatum [also known as St. John's Wort]). If it is necessary to co-administer a strong CYP3A4/5 inducer, dose adjustment is recommended.

AZACITIDINE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SUSPENSION	Treatment of patients	Subcutaneous.
		adults who are not considered	
	Each vial with lyophilisate contains:	suitable for hematopoietic	Adults:
		progenitor cell transplantation and	75 mg/m2 of body surface area, injected daily, for seven
	Azacitidine 100 mg	who suffer from:	days, followed by a rest period of 21 days (treatment
		intermediate II and high-risk	cycle 28 days).
010.000.5887.00	Container with a vial bottle with freeze-dried.	myelodysplastic syndromes.	
			It is recommended that patients receive treatment for a minimum of six cycles.
	·	O	7

Generalities

Azacitidine exerts its antineoplastic effects through various mechanisms, including cytotoxicity on abnormal hematopoietic cells in the bone marrow and DNA hypomethylation. The cytotoxic effects of azacitidine may be due to various mechanisms, including inhibition of DNA, RNA, and protein synthesis, incorporation into RNA and DNA, and activation of pathways that cause DNA damage. The cells

Non-proliferative cells are relatively insensitive to azacitidine. Incorporation of azacitidine into DNA results in inhibition of DNA methyltransferases, leading to DNA hypomethylation. DNA hypomethylation of aberrantly methylated genes, which are involved in the normal regulation pathways of the cell cycle, differentiation and death, can result in the re-expression of genes and the restoration of cancer suppressive functions in cancer cells. The relative importance of DNA hypomethylation versus cytotoxicity or other activities of azacitidine with clinical outcomes has not been established.

Risk in Pregnancy	x	
	Adverse effects	

Pneumonia, nasopharyngitis, febrile neutropenia, neutropenia, leukopenia, thrombocytopenia, anemia, anorexia, dizziness, headache, dyspnea, diarrhea, vomiting, constipation, nausea, abdominal pain, petechiae, pruritus, rash, schimosis, astralgia, fatigue, pyrexia, chest pain , erythema at the injection site, pain at the injection site.

Contraindications and Precautions	
Contraindications and Precautions	

Contraindications: Hypersensitivity to the drug. Pregnancy, lactation, advanced malignant liver tumors. Precautions: Treatment with azacitidine is associated with anemia, neutropenia and thrombocytopenia, especially in the first two cycles. Complete blood counts should be performed when necessary to monitor response and toxicity, but at least before each treatment cycle. After administration of the recommended dose for the first cycle, the dose for subsequent cycles should be reduced or its administration should be delayed depending on the nadir count and hematological response. Patients should be warned to report febrile episodes immediately. Patients and physicians are advised to be alert for signs and symptoms of bleeding.

Renal abnormalities ranging from increased serum creatinine to renal failure and death have been reported in patients treated with intravenous azacitidine in combination with other chemotherapeutic drugs.

Additionally, five patients with chronic myeloid leukemia (CML), treated with azacitidine and etoposide, developed renal tubular acidosis, defined as a decrease in serum bicarbonate to < 20 mmol/L, associated with alkaline urine and hypokalemia (serum potassium < 3 mmol/L). I). If unexplained decreases in serum bicarbonate (< 20 mmol/I) or increases in serum creatinine or NUS occur, the dose should be decreased or administration delayed.

Patients with a known history of cardiovascular or pulmonary disease showed a significantly increased incidence of cardiac events with azacitidine. Therefore, caution is advised when prescribing azacitidine to these patients. Cardiopulmonary evaluation should be considered before and during treatment.

Interactions	

Azacitidine is not mediated by cytochrome P450 (CYP) isoenzymes, UDP-glucuronosyltransferases (UGT), sulfotransferases (SULT) or glutathione transferases (GST); therefore, interactions related to these metabolizing enzymes in vivo are considered unlikely.

IMMUNOTHERAPEUTIC BCG

Clue	Description	Indications	Route of administration and dosage
	SUSPENSION	Treatment of	Intravesical.
	Each vial with lyophilisate contains:	Superficial transitional cell carcinoma of the urinary bladder.	Adults:

Interactions
None of clinical importance.

BENDAMUSTINE

1	Clue	Description	Indications	Route of administration and dosage
	010.000.6325.00	INJECTABLE SOLUTION Each vial contains: bendamustine hydrochloride 100 mg/4 mL Container with 1 vial	Indolent Non-Hodgkin Lymphoma Follicular in patients who have progressed during or after a regimen with Rituximab Relapsed Chronic Lymphocytic Leukemia: Binet B or C in patients for whom combination therapy with fludarabine is not appropriate.	Intravenous Adults 120 mg/m2 days 1 and 2 every 3 weeks. Intravenous Adults 100 mg/m2 body surface area on days 1 and 2 of 4-week cycles, administered over 10 minutes in 50 mL of solution.
			Generalities]

Bendamustine belongs to the alkylating antineoplastic agents, which exerts its **FUNCTION** through the apoptosis of tumor cells through its p53-dependent alkylating activity; which has a more pronounced and longer lasting DNA damaging effect compared to other alkylating agents.

Risk in Pregnancy	d
200	
	Adverse effects

The most common adverse reactions reported with Bendamustine hydrochloride are hematological (leukopenia and thrombocytopenia), dermatological toxicities (allergic reactions), constitutional symptoms (fever) and gastrointestinal symptoms (nausea, vomiting).

Hypersensitivity reactions are common adverse effects of Bendamustine. Anaphylactic reactions including anaphylactic shock have been reported. In immunosuppressed patients, the risk of infection (for example, with herpes zoster) may be increased. There are isolated reports of necrosis after accidental extravascular administration and toxic epidermal necrosis, tumor lysis syndrome and anaphylaxis.

Contraindications and Pre	acoutiona
	ecautions

Contraindications: Hypersensitivity to Bendamustine or any of its components. It is contraindicated in pregnancy and lactation.

Precautions: Should be avoided in case of severe hepatic impairment (serum bilirubin >2.0 mg/dL and/or jaundice). It should not be administered in patients with severe bone marrow suppression and severe alterations in the blood count (leukocyte values less than 3000/ ÿL (microliter) and/or platelets less than 7500/ ÿL (microliter). It should not be administered 30 days before major surgery due to risk of aplasia or post-surgical infection. Its use is not recommended in patients at risk of opportunistic infections or with severe lymphocytopenia. Do not administer if there is received the yellow fever vaccine.

Interactions	

Increased toxicity by myelosuppressants.

Risk of lymphoproliferation due to excessive immunosuppression with cyclosporine, tacrolimus.

Risk of infection with live virus vaccines.

There is a potential for interaction with CYP 1A2 inhibitors such as fluvoxamine, ciprofloxacin, acyclovir, cimetidine, since Bendamustine is metabolized by this isoenzyme.

BEVACIZUMAB (In Catalog II program)

		Risk in Pregnancy	
	Stomatitis, fever, skin rashes, myalgia, pulmona nausea, vomiting, hyperesthesia of the scalp ar		ion, erythroderma, alopecia, skin hyperpigmentation,
	Contraindications: Hypersensitivity to the drug.	Contraindications and Prec	autions

Interactions

With other antineoplastics, their therapeutic and adverse effects increase. The cellular uptake of methotrexate is affected by bleomycin, the glycosides decrease its plasma concentration.

BLINATUMOMAB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Lymphoblastic Leukemia	Administration
		Acute (ALL) B cell precursor chromosom	e Intravenous Adults:
	Each vial with lyophilized powder		In patients weighing 45 kg or more, the dose is 9
	contains:	Philadelphia negative in relapsed or	$\mu g/day$ (fixed dose) from day 1-7 and 28 $\mu g/day$ from day
	Blinatumomab 35 µg	refractory adults and	8-28 in the first treatment cycle. For subsequent cycles administer
		chromosome Philadelphia	28 µg/day on days
010.000.6096.00	Package with one vial with lyophilized powder	negative and positive in relapse or	1-28.
	and one vial with IV stabilizing solution.	refractory in pediatric population.	2 weeks of free treatment should be allowed between blinatumomab cycles.
			Children: In patients weighing 45 kg or more, the dose is 9 µg/day
			(fixed dose) from day 1-7 and 28 $\mu\text{g}/\text{day}$ from day 8-28 in the first
			treatment cycle. For subsequent cycles administer 28 µg/day on
			days 1-28.
			In patients weighing less than 45 kg
			The dose is 5 µg/m2/day (not to exceed 9 µg/day)
			on days 1-7 and 15 µg/m2/day (not exceeding 28
			$\mu g/day)$ on days 8-28 in the first treatment cycle. For subsequent cycles administer
			15 μg/m2/day on days 1 to 28 (not to exceed 28
			μg/day). 2 weeks of free treatment should be allowed between
			blinatumomab cycles.

Generalities

Blinatumomab is a bispecific CD3 T cell coupler, targeting CD19 and binding to CD19, expressed on the surface of B-lineage lymphocytes with CD3 expressed on the surface of T cells. This activates endogenous T lymphocytes by connecting of CD3 in the T cell receptor (TCR) complex with CD19 on benign and malignant B cells. Blinatumomab acts as a mediator in the formation of a cytolytic synapse between the T lymphocyte and the tumor cell, increasing cell adhesion, the production of cytolytic proteins, the release of inflammatory cytokines and the proliferation of T lymphocytes and produces the elimination of CD19 + lymphocytes.

Risk in Pregnancy	с	
[Adverse effects	

Cytosine release syndrome, neurological toxicity, infections, tumor lysis syndrome, Neutropenia and febrile neutropenia, effects on the ability to drive and use machinery, elevated liver enzymes and leukoencephalopathy.

	Contraindications and Precautions
Contraindications and Precautions: Hypers	ensitivity to the drug.
	Interactions

Initiation of treatment with Blinatumomab causes transient release of cytokines that may suppress enzymes. CYP450. No interactions between drugs and Blinatumomab have been studied.

BORTEZOMIB

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Multiple myeloma in	Intravenous
		relapsed and/or refractory.	
	Each vial with lyophilisate contains		Adults:
			1.3 mg/m2 body surface area/dose.
	Bortezomib 3.5 mg		
			Administer as an intravenous bolus twice a week for two
010.000.4448.00	Container with a vial.		weeks (days 1, 4, 8 and 11) followed by a 10-day rest
			period (days 12 to 21). At least 72 hours should elapse
			between consecutive doses.
			T
			These 3 weeks are considered a treatment cycle.
			_

Generalities

The active ingredient of Bortezomib is modified dipeptidyl acid, which is a reversible proteasome inhibitor. 26S, protein complex with chymotrypsin-like activity in mammalian cells. The 26S proteasome is a large protein complex that degrades ubiquitinated proteins.

Risk in Pregnancy	x
Ĩ	Adverse effects

Fatigue, weakness, nausea, diarrhea, decreased appetite (including anorexia), constipation, thrombocytopenia, peripheral neuropathy, fever, vomiting and anemia.

	Contraindications and Precautions
itivity to the	drug.

Contraindications: hypersensitivity to the drug. Precautions: Peripheral neuropathy, hypotension.

Interactions

Concomitantly with other drugs that inhibit or induce cytochrome P450 3A4, they should be closely monitored for the timely detection of toxic effects or detection of reduced efficacy of Bortezomib. In vitro studies with human liver microsomes indicate that the active ingredient of Bortezomib is a substrate of cytochrome P450 3A4, 206, 2C19, 2C9 and 1A2.

BRENTUXIMAB VEDOTIN (In prescription monitoring program)

Clue	Description	Hodgkin	Route of administration and dosage
	INJECTABLE SOLUTION	lymphoma indications relapsed or refractory.	Intravenous.
	Each vial with lyophilized powder contains:		1.8 mg/Kg of body weight administered by intravenous infusion applied over
			a period of 30 minutes, once every three weeks.
	Brentuximab Vedotin 50 mg		
010.000.6085.00	Container with a vial with lyophilized powder.		It should not be administered as a rapid intravenous injection or bolus.

Generalities

Brentuximab Vedotin is an antibody conjugate (AbC) that delivers an antineoplastic agent that selectively produces apoptotic cell death of CD30-expressing tumor cells.

d

Adverse effects

Peripheral sensory neuropathy, fatigue, nausea, diarrhea, pyrexia, upper respiratory tract infection, neutropenia, vomiting and cough.

Contraindications	and Procautions
Contrainuications	and Frecautions

Contraindications: Hypersensitivity to the drug.

Precautions: In combination with bleomycin it causes pulmonary toxicity.

Interactions

CYP3A4 Inhibitors, Inducers, and Substrates: Coadministration of brentuximab vedotin with ketoconazole, a strong CYP3A4 inhibitor, did not alter brentuximab vedotin exposure; however, a moderate increase in MMAE exposure was observed. Patients receiving strong CYP3A4 inhibitors concomitantly with brentuximab vedotin should be closely monitored for adverse events.

Clue	Description	Indications	Route of administration and dosage
	TABLET	granulocytic leukemia chronicle.	Oral.

Maintenance dose: 1 to 3 mg daily. It will be adjusted according to hematological and clinical response. Children: 0.06 to 0.12 mg/kg body weight or 1.8 to 4.6 mg/m2 body surface area, daily.
	Each mL contains:		
	Busulfan 6.0 mg.		
		Generalities	
Alkylant that inter	feres with DNA replication and RNA tra	inscription. At conventional c	loses it only has myelosuppressive properties

Adverse effects

Myelosuppression, fetal malformations, hyperuricemia, interstitial pulmonary fibrosis and Addison's disease-like syndrome.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Precautions: In hyperuricemia, gout and immunosuppressed.

Frecautions. In hyperuncernia, gout and initial

Interactions

With furosemide, thiazides, ethambutol and pyrazinamide the risk of hyperuricemia increases.

CABAZITAXEL

	Clue	Description	Indications	Route of administration and dosage
1		INJECTABLE SOLUTION	Metastatic cancer of	Intravenous infusion.
			prostate refractory to hormonal	
		Each vial contains:	therapy, previously treated with a	25 mg/m2 body surface area for 1 hour, every 3
		Cabazitaxel acetone solvate 60 mg	regimen containing Docetaxel.	weeks, in combination with
				10 mg prednisone (or prednisolone).
	010.000.5658.00	Container with a vial bottle with		
		1.5 mL and a vial with 4.5 mL of diluent.		
			0	7
			Generalities	

Cabazitaxel is an antineoplastic agent that acts by disrupting the microtubular network in cells.

Cabazitaxel binds to tubulin and promotes the attachment of tubulin to microtubules while simultaneously inhibiting their disassembly. This results in the stabilization of microtubules, resulting in the inhibition of mitotic and interphase cellular functions.

Risk in Pregnancy		d
	Adverse	effects

Neutropenia, leukopenia, anemia, febrile neutropenia, diarrhea, fatigue and asthenia, nausea, vomiting, constipation, abdominal pain, dyspepsia, upper abdominal pain, hemorrhoids, reflux disease, fatigue, pyrexia, mucosal inflammation, musculoskeletal and spinal disorders connective tissue, back pain, arthralgia, muscle spasms, metabolism and nutrition disorders, anorexia, dehydration, renal and urinary tract disorders, hematuria, dysuria, urinary incontinence, acute renal failure, respiratory, thoracic and mediastinal disorders, dyspnea, cough , skin and subcutaneous tissue disorders, alopecia, infections and infestations, urinary tract infection, nervous system disorders, dysgeusia, peripheral neuropathy, vertigo, headache, peripheral sensory neuropathy.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Neutrophil count ÿ 1,500/mm3, liver failure (bilirubin ÿ 1 x ALN, or AST/SGTO and/or ALT/SGTP ÿ 1.5 x ALN). It is essential to monitor complete blood count weekly during the 1st cycle and subsequently before each treatment cycle, so that the dose can be adjusted, if necessary. Reduce the dose in case of febrile neutropenia or prolonged neutropenia, despite appropriate treatment.

Restart treatment only when neutrophils recover to a level of ÿ 1,500/mm3.

	10
Interactions	
 	0) (50.1

In vitro studies have shown that cabazitaxel is primarily metabolized by CYP3A. Although specific drug interaction trials have not been performed for cabazitaxel, concomitant administration of strong CYP3A inhibitors (e.g., ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole) increase cabazitaxel concentrations. Therefore, coadministration with strong CYP3A inhibitors should be avoided. Caution should be exercised with concomitant use of moderate CYP3A inhibitors.

Although specific drug interaction trials have not been performed for cabazitaxel, concomitant administration of strong CYP3A inducers (e.g. phenytoin, carbamazepine, rifampicin, rifabutin, rifapentine, phenobarbital) would be expected to reduce cabazitaxel concentrations. Therefore, coadministration with strong CYP3A inducers should be avoided. Additionally, patients should refrain from taking St. John's wort or St. John's wort.

In vitro, cabazitaxel has also been shown to inhibit the transport of Organic Anion Transporting Polypeptide OATP1B1 proteins. The risk of interaction with OATP1B1 substrates (e.g. statins, valsartan, repaglinide) is possible, particularly during the duration of the infusion (1 hour) and up to 20 minutes after completion of the infusion. A time interval of 12 hours before infusion and at least 3 hours after completion of the infusion is recommended before administering OATP1B1 substrates.

Administration of live or live-attenuated vaccines in patients immunocompromised by chemotherapeutic agents may result in serious or fatal infections. Vaccination with live-attenuated vaccines should be avoided in patients treated with cabazitaxel. Killed or inactivated vaccines can be administered; however, the response to these vaccines may decrease.

CAPECITABINE

Clue	Description	Indications	Route of administration and dosage
	TABLET	Breast cancer.	Oral.
010.000.5460.00	Each tablet contains: Capecitabine 150 mg Package with 60 tablets. TABLET	Breast cancer.	Adults: Breast cancer: 2,500 mg/m2 body surface area/day, divided into two doses. Treatment cycles are two weeks with one week off.
010.000.5461.00	Each tablet contains: Capecitabine 500 mg Package with 120 tablets.	Adjuvant and metastatic colorectal cancer. Contraindications	· Hypersensitivity to the drug cisplatin c	r compounds containing platir	um or mannitol, bone marrow depression		

ng platinum or man ug, cisplatin, or compounds contain itoi, do aep ιy renal failure.

Precautions: Do not use equipment containing aluminum for administration.

Interactions

Enhances the effect of other oncological medications and radiotherapy. Nephrotoxic agents or bone marrow depressants potentiate these toxic effects.

CARFILZOMIB

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION Each vial with lyophilized powder contains: Carfilzomib 60 mg	Treatment of patients with relapsed and refractory multiple myeloma, and who have received at least two prior therapies, including bortezomib and an immunomodulatory agent.	intravenous, Adults: Dose of 20 mg/m2 body surface area in cycle 1 on days 1 and 2. If tolerated, the dose should be increased to
010.000.6086.00	Container with vial bottle with lyophilized powder.	Carfilzomib in combination with lenalidomide plus dexamethasone for the treatment of patients with Relapsed or Refractory Multiple Myeloma who have received one to three lines of therapy.	 27 mg/m2 body surface area on day 8 of cycle 1. administer intravenously on two consecutive days, every week for three weeks (days 1, 2, 8, 9, 15 and 16), followed by a 12-day rest period (days 17 to 28). Each 28-day period is considered a treatment cycle. Initial carfilizomib dose of 20 mg/m2 body surface area in cycle 1 on days 1 and 2. If tolerated, the dose should be increased to 27 mg/m2 body surface area on the same day.
			8 of cycle 1. From cycle 13, skip doses on days 8 and 9. Discontinue after Cycle 18. Lenalidomide 25 mg is administered orally on Days 1 to 21 and dexamethasone 40 mg orally or intravenously on days 1, 8, 15 and 22 of the 28-day cycles.
		Generalities	1

Carfilzomib is an epoxyketone tetrapeptide proteasome inhibitor that selectively and irreversibly binds to the N-terminal threoninecontaining active sites of the 20S proteasome, the proteolytic core particle within the 26S proteasome, and shows little or no activity against other classes of proteases. Carfilzomib showed antiproliferative and proapoptotic activities in preclinical models in solid and hematological tumors. In animals, carfilzomib

inhibits proteasome activity in blood and tissues and delays tumor development in models of multiple myeloma, hematological and solid tumors

Risk in Pregnancy	d
	Adverse effects

Thrombocytopenia, nausea, diarrhea, vomiting, fatigue, pyrexia, chills, increased blood creatinine and elevated aspartate aminotransferase and dyspnea; infusion-related and infusion site reactions, elevated alanine aminotransferase; uncommon, tumor lysis syndrome.

Contraindications and P	recautions
-------------------------	------------

Contraindications: Hypersensitivity to the drug.

Precautions: Cardiopulmonary disorders, infusion reactions, tumor lysis syndrome, thrombocytopenia, liver toxicity, neutropenia.

Interactions

Carfilzomib is primarily metabolized through the activity of peptidases and epoxide hydrolases and, as a result, the pharmacokinetic profile of carfilzomib is unlikely to be affected by concomitant administration of cytochrome P450 inhibitors and inducers. Carfilzomib is not expected to influence the exposure of other drugs.

CARMUSTINE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION.	Hodgkin's disease.	Intravenous infusion.
	Each vial with lyophilisate contains:	Non-Hodgkin's lymphoma.	Adults:
	Carmustine 100 mg	Multiple myeloma.	75 to 100 mg/m2 of body surface area, daily for 2 days, repeat every 6 weeks with platelet control and leukocyte
010.000.1758.00	Container with a vial and sterile diluent (absolute ethanol) 3 mL.	Malignant melanoma.	count.
		Primary brain carcinoma.	The dose is reduced by 50% below 2
			000/mm3 leukocytes and less than 25 000/mm3 of platelets.
			Alternative regimen 200 mg/m2 body surface, single
			dose, repeat every 6 to 8 weeks.
		• • • •	
		Generalities]

It cross-links cellular DNA strands and interferes with RNA transcription, causing an imbalance in development that leads to cell death. It is nonspecific for the cell cycle.

Risk in Pregnancy d

Adverse effects

Anorexia, nausea, bone marrow depression, leukopenia, thrombocytopenia, injection site pain, skin hyperpigmentation, nephrotoxicity, hepatotoxic, hyperuricemia, pulmonary fibrosis.

Interactions

Cimetidine may increase bone marrow toxicity. Do not use them combined.

CERITINIB

Clue	Description	Indications	Route of administration and dosage
	CAPSULES	Patient treatment Adults with anaplastic lymphoma	Oral.
010.000.6301.00	Each capsule contains: Ceritinib 150 mg. Container with 150 capsules.	kinase (ALK)-positive advanced non- small cell lung cancer previously treated with crizotinib.	750 mg administered orally, once a day.
		Generalities	

Highly selective and potent oral inhibitor of anaplastic lymphoma kinase (ALK). Ceritinib inhibits ALK autophosphorylation, ALK-mediated phosphorylation of downstream signaling pathway proteins, and ALK-dependent cancer cell proliferation in vitro and in vivo.

	Risk in Pregnancy
X (Its administration is not recomm	nended during pregnancy)
	Adverse effects

Anemia; decreased appetite, hyperglycemia, hypophosphatemia, visual disturbance, pericarditis, bradycardia, pneumonitis, diarrhea, nausea, vomiting, abdominal pain, constipation, esophageal disturbance, pancreatitis, abnormal liver function parameters, hepatotoxicity, rash; renal failure, fatigue, abnormal liver laboratory parameters, weight decreased, blood creatinine increased, electrocardiogram QT prolongation, lipase increased, amylase increased

Interactions

Plasma concentrations increased by: strong CYP3A/P-gp inhibitors. Concomitant use with strong CYP3A inducers (including, but not limited to, ritonavir, saquinavir, telithromycin, ketoconazole, itraconazole, voriconazole, posaconazole, and nefazodone) should be avoided.

CETUXIMAB (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Colorectal cancer	Intravenous infusion.
		refractory metastatic.	
	Each vial contains:		Adults:
	Cetuximab 100 mg	Recurrent or metastatic head and neck	
		squamous cell cancer.	Initial dose:
010.000.5475.00	Container with vial bottle with 50 mL (2 mg/mL).		400 mg/m2 of body surface in the first week of treatment.
010.000.5475.01	Container with vial bottle with 20 mL (5 mg/mL).		Maintenance dose: 250 mg/m2 body surface once a week. Administer undiluted.

Generalities

Cetuximab is a chimeric IgG1 monoclonal antibody that binds specifically and with high affinity to EGFR, and competitively inhibits the binding of endogenous ligands. This reduces cellular functions involved in tumor growth, development, and metastasis, such as tumor proliferation, survival, cell invasion, DNA repair, and angiogenesis. It also induces the internalization of EGFR, which can lead to a decrease in the density of these receptors. By binding to EGFR expressed by tumor cells, cetuximab also activates the antibody-mediated cytotoxic cellular immune response.

Adverse effects

There is no evidence that the safety profile of cetuximab is influenced by antineoplastic agents or vice versa. In combination with irinotecan, additional adverse reactions are those that might be expected with irinotecan, such as diarrhea, nausea, vomiting, mucositis, fever, leukopenia and alopecia. Acne-type rash and nail alterations.

Contraindications: hypersensitivity to the drug.

Precautions: During pregnancy and lactation. No studies have been conducted in children or in patients with disorders hematological or pre-existing renal and hepatic functions (serum creatinine ÿ 1.5 times, transaminases ÿ 5 times and bilirubin ÿ 1.5 times in relation to the upper normal limits).

Interactions	

A formal interaction study in humans showed that the pharmacokinetics of cetuximab and irinotecan did not change after coadministration. Clinical data did not show any influence on the safety profile of cetuximab or vice versa. In clinical studies for colorectal cancer, non-small cell lung cancer and squamous cell head and neck cancer, different antineoplastic therapeutic modalities were used in first or second lines within the regimens used were: FOLFOX (5-flourouracil, Folinic acid Oxaliplatin) FOLFIRI (5-flourouracil, Folinic Acid, Irinotecan) CV (cisplatin, vinorelbine), Bevacizumab, platinum or carboplatin. In none of the studies were significant drug interactions or significantly increased toxicity found.

	CHLORIDE	Indications	
Clue	Description INJECTABLE SOLUTION	Indications Treatment of patients	Route of administration and dosage Intravenous.
	Fach sid contains Obly 11	with castration-resistant prostate cancer with symptomatic bone	Adults:
	Each vial contains: Chloride of radius 223 6600 KBq	metastases without visceral	55 KBq per kg body weight administered at 4-week
	corresponding to 3.5 ng of radius 223	disease or known visceral disease.	intervals for a total of 6 injections.
010.000.6166.00	Lead container with a vial with 6 mL of solution (1100		
	KBq/mL).		

The active group of Radium-223 Chloride is the calcium-limiting isotope radium-223 and selectively targets bones, especially areas of bone metastases, by forming complexes with the bone mineral hydroxyapatite. The high linear energy transfer of alpha emitters (80 keV/micrometer) produces double-stranded DNA fractures.

Generalities

chain in adjacent cells, resulting in a potent and localized antitumor effect. The range of the radium 223 alpha particle is less than 100 micrometers (less than 10 cell diameters) which minimizes damage to surrounding normal tissue.

There are no compatibility studies, so radium 223 should not be mixed with other medications. Concomitant chemotherapy may have additive effects on bone marrow suppression, but the safety and efficacy of concomitant chemotherapy with radium-223 have not been established.

CRIZOTINIB

Clue	Description	Indications Lung	Route of administration and dosage
	CAPSULE	cancer	Oral.

010.000.5770.00	Container with 60 capsules.		dose may be decreased to
	CAPSULE	1	200 mg 2 times a day. If a greater decrease is required,
			administer 250 mg once a day.
	Each capsule contains:		
	Crizotinib 250 mg		
010.000.5771.00			
010.000.3771.00	Container with 60 capsules.		

Generalities

Crizotinib is a small molecule, selective inhibitor of the ALK receptor tyrosine kinase (RTK) and its oncogenic variants (i.e., ALK fusion events and selected ALK mutations). Crizotinib also inhibits the tyrosine kinase activity of the hepatocyte growth factor receptor (HGFR, c-Met). Crizotinib demonstrated concentration-dependent inhibition of ALK and c-Met kinase activity in biochemical assays, and in cellular assays it inhibited phosphorylation and modulated kinase-dependent phenotypes. Crizotinib demonstrated potent and selective growth inhibitory activity and induced apoptosis of tumor cell lines displaying ALK fusion events (such as EML4-ALK and NPM-ALK) or displaying amplification of the *MET* or *ALK gene locus*. Crizotinib demonstrated antitumor efficacy, including marked cytoreductive activity, in mice bearing tumor heterografts expressing ALK fusion proteins. The antitumor efficacy of crizotinib was dose-dependent and showed a correlation with pharmacodynamic inhibition of phosphorylation of ALK fusion proteins (such as EML4-ALK and NPM-ALK) in tumors *in vivo*.

Risk in Pregnancy	с
	Advorso offocts

Vision disorders, nausea, diarrhea, vomiting, edema, constipation and fatigue. increased ALT, neutropenia, hepatotoxicity with fatal outcome, severe pneumonitis, QT prolongation.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, severe kidney or liver disease.

Precautions: Liver function tests, including ALT, AST, and total bilirubin, should be performed twice monthly during the first two months of treatment, and monthly thereafter and when clinically indicated, with more frequent repetition of the tests. determinations in case of increases of degree 2, 3 or 4. You must

Crizotinib treatment should be discontinued if pneumonitis is suspected. Other causes of pneumonitis should be excluded, and Crizotinib treatment must be permanently suspended in patients diagnosed with treatment-related pneumonitis. Crizotinib should be administered with caution in patients with a history of or predisposition to QTc prolongation, or who are receiving medications with a known QT prolonging effect. When Crizotinib is used in these patients, periodic monitoring by electrocardiogram and determination of electrolytes should be performed.

Interactions

Concomitant use of strong CYP3A inhibitors (certain protease inhibitors such as atazanavir, indinavir, nelfinavir, ritonavir, saquinavir, and certain azole antifungals such as itraconazole, ketoconazole, and voriconazole, and certain macrolides such as clarithromycin, telithromycin, and troleandomycin) should be avoided. Grapefruit can increase

plasma concentrations of crizotinib, so it should be avoided. Concomitant use of strong CYP3A inducers, including carbamazepine, phenobarbital, phenytoin, rifabutin, rifampicin, and St. John's wort, should be avoided.

Concomitant administration of crizotinib with CYP3A substrates with a narrow therapeutic index, including alfentanil, cisapride,

cyclosporine, ergot derivatives, fentanyl, pimozide, quinidine, sirolimus and tacrolimus, should be avoided. If the combination is necessary, close monitoring should be performed.

The dose should be adjusted at the discretion the specialist.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, infections, chickenpox and herpes zoster. Precautions: Use with caution in patients with decreased kidney or liver function, or with bone marrow disorders.

Interactions

Immunosuppressive or myelosuppressive medications favor its adverse effects.

DACTINOMICIN Clue Indications Description Route of administration and dosage INJECTABLE SOLUTION Choriocarcinoma. Intravenous infusion. Wilms tumor. Adults: Each vial with lyophilisate contains: Rhabdomyosarcoma Dactinomycin 0.5 mg 10 to 15 µg/kg body weight/day or 400 to 600 mg/m2 body surface area/day, for five days, repeat every three 010.000.4429.00 Container with a vial to four weeks according to toxicity. Kaposi sarcoma Ewing's sarcoma Children 0.015 mg/kg body weight/day, for 5 days The dose should be adjusted at the discretion of the specialist. Administer diluted in intravenous solutions packaged in glass bottles. Generalities It interferes by intercalation with DNA-dependent RNA synthesis. Risk in Pregnancy C Adverse effects

Anemia, leukopenia, thrombocytopenia, pancytopenia, anorexia, nausea, vomiting, abdominal pain, diarrhea, stomatitis, erythema, skin hyperpigmentation, acneiform eruptions, phlebitis, reversible alopecia and hepatotoxicity.

Contraindications and Precautions
Contraindications: Hypersensitivity to the drug.
Precautions: in patients with decreased kidney or liver function, or with alterations in the bone marrow.
Interactions

None of clinical importance.

DAROLUTAMIDE

	Clue	Description		Indications	Route of administration and dosage
		TABLET		Patient treatment	Oral.
				with non-metastatic castration-	
		Each tablet contains:		resistant prostate cancer	Adults:
		Darolutamide 300 mg		(nmCRPC)	600 mg (two coated tablets)
					300 mg) twice a day, equivalent to the total daily dose of
5	010.000.7076.00	Cardboard box with bottle with 120 attached instructions	tablets and		1200mg
		1	(Generalities	1

Darolutamide is an androgen receptor (AR) inhibitor. Darolutamide competitively inhibits androgen binding, RA nuclear translocation, and RA-mediated transcription. A major metabolite, ketodarolutamide, exhibited similar in vitro activity to darolutamide. Furthermore, darolutamide functioned as a progesterone receptor (PR) antagonist in vitro (approximately 1% activity compared to RA). Darolutamide reduced prostate cancer cell proliferation in vitro and tumor volume in prostate cancer xenograft models in mice.

Risk in Pregnancy

The safety and effectiveness of darolutamide in women have not been established. Based on its mechanism of action, darolutamide may cause fetal harm and pregnancy loss. Animal embryofetal developmental toxicology studies were not performed with darolutamide. There are no human data on the use of darolutamide in pregnant women.

Adverse reactions	
-------------------	--

Tiredness, pain in extremities, rash, hypertension, diarrhea, pneumonia, nausea, ischemic heart disease, and failure

cardiac.

Contraindications and Precautions	

Contraindications: Hypersensitivity to the components of the formula.

Precautions: Patients with severe renal impairment (eGFR 15-29 mL/min/1.73m2) who are not receiving hemodialysis have increased exposure to darolutamide and a dose reduction is recommended. Patients with moderate hepatic impairment (Child Pugh Class B) have increased exposure to darolutamide and a dose reduction is recommended.

Interactions

Avoid concomitant use of darolutamide with combined P-gp inducers and strong or moderate CYP3A4 inducers. Avoid concomitant use with medications that are substrates of breast cancer resistance proteins (BCRP) when possible.

DASATINIB (In Catalog II program)

Clue	Description	Lymphoblastic		Route of administration and dosage
	TABLET	Acute	indications	Oral.
		leukemia,	chromosome	
	Each tablet contains:	Philadelphia p	ositive.	Adults:
	Dasatinib 50 mg			
			id leukemia with	100 mg every 24 hours in a single dose.
010.000.4323.00	Package with 60 tablets.	resistance or ir	ntolerance to	
		previous thera	py.	
	2 			_

Generalities

It inhibits the activity of BCR-ABL kinase and SRC family kinases along with other specific oncogenic kinases including c-KIT, ephrin receptor (EPH) kinases and the PDGF receptor. It is a potent inhibitor, at subnanomolar concentrations (0.6-0.8 nM), of the BCR-ABL kinase. It binds not only to the inactive conformation of the BCR-ABL enzyme, but also to the active one.

Risk in Pregnancy d

Adverse effects

Ascites, pulmonary edema, pericardial effusion with or without superficial edema, diarrhea, rash, headache, bleeding, fatigue, nausea, dyspnea, musculoskeletal pain, fever and febrile neutropenia.

Contraindications: Hypersensitivity to the drug. Precautions: Patients with moderate to severe liver failure, in those who use antiplatelet or anticoagulants and QTc prolongation.

With strong CYP3A4 inhibitors or inducers. In acid-peptic disease, consider the use of antacids instead of H2-antagonists or proton pump inhibitors.

DAUNORUBICIN

Clue Description Inc		Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Lymphocytic leukemia	Intravenous infusion.
010.000.4228.00	Each vial with lyophilisate contains: Daunorubicin hydrochloride equivalent to 20 mg of daunorubicin. Container with a vial.	acute and acute granulocytic.	Adults: 30 to 60 mg/m2 of body surface area/day, for 3 days, repeat in 3 to 4 weeks. Children over 2 years: 25 mg/ m2 of body surface area / day. Administer diluted in solutions IVs packaged in glass bottles.
		Generalities]

It interferes by intercalation with DNA-dependent RNA synthesis.

Risk in Pregnancy d

Adverse effects

Nausea, vomiting, stomatitis, esophagitis, anorexia, diarrhea, bone marrow depression, irreversible cardiomyopathy,

arrhythmias, pericarditis, myocarditis, erythema, nail pigmentation, alopecia, fever, hepatotoxicity, nephrotoxicity, hyperuricemia.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: In decompensated heart disease, depressed bone marrow and kidney or liver failure.

Interactions

With cardiotoxic and myelosuppressive medications, adverse effects increase.

DEGARELIX

Clue Description		Route of administration and dosage
INJECTABLE SOLUTION	Prostate cancer advanced.	Subcutaneous.
Each vial with lyophilisate contains:		Adults:
Degarelix 120 mg		Starting dose: 240 mg administered in two injections of 120 mg each . Maintenance dose -monthly administration 80 mg.
Container with two vials with lyophilisate and two vials with		
6 mL of diluent each, 2 syringes, 2 needles for reconstitution and 2 needles for injection.		The first maintenance dose should be administered one month after the starting dose.
Container with two vials with lyophilisate, 2 prefilled syringes with 3 mL of diluent, 2 adapters, 2 plungers, and 2 sterile needles.		
INJECTABLE SOLUTION		
Each vial with lyophilisate contains:		
Degarelix 80 mg		
Package with one vial with lyophilisate and one vial with 6 mL of diluent, 1 syringe, 1 needle for reconstitution and 1 needle for injection.		
Container with a vial with lyophilisate, a prefilled syringe with 4.2 mL of diluent, 1 vial adapter, 1 plunger, and a sterile needle.		
	INJECTABLE SOLUTION Each vial with lyophilisate contains: Degarelix 120 mg Container with two vials with lyophilisate and two vials with 6 mL of diluent each, 2 syringes, 2 needles for reconstitution and 2 needles for injection. Container with two vials with lyophilisate, 2 prefilled syringes with 3 mL of diluent, 2 adapters, 2 plungers, and 2 sterile needles. INJECTABLE SOLUTION Each vial with lyophilisate contains: Degarelix 80 mg Package with one vial with lyophilisate and one vial with 6 mL of diluent, 1 syringe, 1 needle for reconstitution and 1 needle for injection. Generalities

Selective antagonist of the GnRH receptor, which binds competitively and reversibly with the GnRH receptors of the pituitary gland, rapidly reducing the release of gonadotrophins and consequently the concentration of testosterone to the level of "medical castration" (T < 0.5 ng / mL .

Risk in Pregnancy			NE
		Adverse	effects

Adverse effects

Hot flashes and increase in body weight (25% and 7%). Pain, erythema and inflammation at the injection site. Antiandrogen is not required, because it does not produce the "flare" effect.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Patients with a history of psychotic disorders. In patients who wish to conceive, treatment should be interrupted, as long as there is very close monitoring of the concentration of PSA and Testosterone. serum.

Interactions	

No pharmaceutical product-pharmaceutical product interaction studies have been carried out.

DENOSUMAB (In prescription control program)

	INJECTABLE SOLUTION Each vial contains: Denosumab 120 mg	INJECTABLE SOLUTION Prevention of events related to the skeleton/(flathological fractures, bone radiotherapy, spinal cord compression or bone surgery) patients with advanced malignant Container with a vial bottle with

Generalities

Denosumab is a humanized monoclonal antibody (IgG2) that targets and binds with high affinity and specificity to the RANKL receptor, preventing its activation; which is found on the surface of osteoclasts and their precursors.

RANK ligand exists as a transmembrane or soluble protein. RANK ligand is essential for the formation, function and survival of osteoclasts, the only cell type responsible for bone resorption. The increase in osteoclast activity, stimulated by the RANK ligand, is a key mediator in bone destruction in bone disease in metastatic tumors and in multiple myeloma. Prevention of the interaction of the RANK ligand with the receptor results in a reduction in the number and function of osteoclasts, decreasing cancer-induced bone resorption and destruction.

Risk in Pregnancy	с
	Adverse effects

Urinary tract infection, upper respiratory tract infection, sciatica, cataracts, constipation, abdominal discomfort, rash, eczema, pain in extremities, musculoskeletal pain.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: It is important that all patients receive an adequate supply of calcium and vitamin D. Hypocalcemia, skin infections, osteonecrosis of the jaw, atypical femur fractures, kidney failure.

	Interactions
No drug-drug interaction studies have been perform	ned with Denosumab.

I

DEXRAZOXANE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Prevention of	Intravenous.
		anthracycline-induced cardiotoxicity.	
	The vial contains: Dexrazoxane hydrochloride equivalent to 500 mg		Adults and children candidates to receive anthracyclines
	of dexrazoxane.		Dose according to the anthracycline used and according to the doctor's judgment.
010.000.4444.00	Container with a vial.		

Generalities

Prodrug analogous to EDTA that, through its chelating action, prevents the formation of Fe complexes ++-anthracyclines (antineoplastics) preventing the cardiotoxic effects of antineoplastic drugs.

Ris	sk in Pregnancy NE
	Adverse effects
Leukopenia, nausea, vomiting.	
	Contraindications and Precautions
Contraindications: Hypersensitivity to	o the drug.
Precautions: In myelosuppression, h	eart disease or liver disease.

None of clinical importance.

DOCETAXEL

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	lung cancer not small cells.	Intravenous infusion.
	Each vial contains: Docetaxel anhydrous or trihydrate equivalent to 80 mg. docetaxel	Small cell lung cancer.	Adults: 100 mg/m2 body surface area/day, each 3 weeks.
010.000.5437.00	Package with a vial with 80 mg and a vial with 6 mL of diluent.	Breast cancer.	
		Ovarian cancer.	
010.000.5437.01	Container with vial bottle with 80 mg with 4 mL.		
010.000.5437.02	Container with vial bottle with 80 mg with 8 mL.		
	INJECTABLE SOLUTION		
	Each vial contains: Docetaxel anhydrous or trihydrate equivalent to 20 mg. docetaxel		
010.000.5457.00	Container with vial bottle with 20 mg and vial bottle with 1.5 mL of diluent.		
010.000.5457.01	Container with vial bottle with 20 mg with 1 mL.		
010.000.5457.02	Container with vial bottle with 20 mg with 2 mL.		

Generalities

Antineoplastic that promotes the binding of tubulin within microtubules and inhibits its unbinding, this causes a decrease in free tubulin. It disrupts the microtubule network in cells, which is essential for mitosis and interphase functions.

Adverse effects

Leukopenia, neutropenia, anemia, thrombocytopenia, fever, hypersensitivity reactions, fluid retention, stomatitis, paresthesia, dysesthesia and alopecia.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug and taxols. Precautions: Assess risk benefit in neutropenia, hyperbilirubinemia, fever, infections, thrombocytopenia and severe stomatitis.

Interactions

.

Its adverse effects increase with bone marrow depressants, radiotherapy, immunosuppressants, inhibitors of the liver microsomal enzyme system and vaccines (killed or live viruses).

	equivalent to 20 mg.	Ovarian cancer.	20 mg/m2 body surface every 2 or 3 weeks.
010.000.1766.00	of doxorubicin or doxorubicin (2 mg/ mL).	breast cancer metastatic.	
	Package with a vial with 10 mL (2 mg/ mL).		
		Generalities]
It interferes by interferes by interferes by interferes by interferes by interferes by interference by the second se	ercalation with DNA-dependent RNA syr	nthesis.	
	Risk in Pregnancy	d	

Adverse effects

Leocopenia, agranulocytosis, thrombocytopenia, cardiac arrhythmias, irreversible cardiomyopathy. Hyperuricemia, nausea, vomiting, diarrhea, stomatitis, esophagitis, alopecia. Hyperpigmentation in radiated areas and cellulitis or slough if the medication extravasates.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Precautions: In myelosuppression, heart disease or liver disease.

Interactions

With streptokinase since it increases blood values. Do not mix with heparin.

ENZALUTAMIDE (In prescription monitoring program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Patients with cancer	Oral.
	Each capsule contains: Enzalutamide 40 mg	metastatic castration-resistant prostate who have received treatment with Docetaxel.	Adults: 160 mg per day.
010.000.6097.00	Container with 120 capsule	S. Patients with metastatic castration-resistant prostate cancer who are asymptomatic or mildly symptomatic after unsuccessful androgen deprivation therapy, and for whom chemotherapy is not yet clinically indicated.	
		Generalities	

Potent inhibitor of androgen receptor signaling that blocks several steps in the signaling pathway

of the androgen receptor. It competitively inhibits the binding of androgens to androgen receptors, inhibits the nuclear translocation of activated receptors and inhibits the association of the activated androgen receptor with DNA, even in situations of overexpression of the receptor and resistant prostate cancer cells. to antiandrogens.

	Risk in Pregnancy Does not apply
	Adverse effects
and headache.	
	Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: In patients with a history of seizures or other predisposing risk factors including but not limited to underlying brain damage, stroke, primary brain tumors or brain metastases, or alcoholism.

Use with caution with drugs with a narrow therapeutic range that are substrates of CYP3A4 enzymes, CYP2C9, CYP2C19 and UGT1A1, and dose adjustments may be necessary to maintain therapeutic plasma concentrations.

Interactions

Warfarin and coumaric type coagulants.

EPIRUBICIN

Fatigue, hot flush

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	lymphoblastic leukemia	Intravenous.
010.000.1773.00	Each container contains: Epirubicin hydrochloride 10 mg Container with a vial with lyophilisate or container with a vial with 5 mL of solution (10 mg/5 mL).	acute. Acute myeloblastic leukemia. Hodgkin's lymphoma. Non-Hodgkin's lymphoma. Neuroblastoma. Sarcoma of soft tissues and bone.	Adults: Dilute in a sodium chloride solution and administer at a rate of 90 to 110 mg/m2 of body surface over a period of 3 to 5 minutes every three weeks, monitoring bone marrow recovery.
	INJECTABLE SOLUTION Each container contains: Epirubicin hydrochloride 50 mg	Breast cancer. Ovarian cancer. Thyroid cancer. Bladder cancer.	The cumulative dose should not exceed 700 mg/m2 of body surface.
010.000.1774.00	Container with a vial with lyophilisate or container with a vial with 25 mL of solution (50 mg/25 mL).		The dose and route of administration must be adjusted at the discretion of the specialist. Administer diluted intravenous solutions packaged in glass vials.

Generalities It is a cytotoxic anthracycline derivative with antineoplastic properties and toxicity similar to doxorubicin. It intercalates with DNA, affects its functions and inhibits the synthesis of nucleic acids.

	Risk in Pregnancy] d	
	Adverse	effects]
, , , , ,	g, stomatitis, diarrhea, conjunctivitis, ue to extravasation, hypersensitivity	· ·	sion. Cardiomyopathy, arrhythmias,

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Precautions: In heart or liver failure.

Interactions

Administered with actinomycin D and/or radiotherapy, its effects are enhanced. It is not chemically compatible with heparin. Adverse effects increase with cardiotoxic medications.

ERLOTINIB

EVEROLIMUS

Clue	Description	Indications	Route of administration and dosage	
010.000.5651.00	Compressed Each tablet contains: Everolimus 5 mg Package with 30 tablets.	Second line treatment for adults with metastatic renal cell cancer. Treatment of advanced cancer in mother combination in with exemestane, in postmenopausal women with positive hormone receptors and negative HER2 who failed non- steroidal aromatase inhibitors.	Oral. Adults: 10 mg every 24 hours.	
Generalities				

It is a selective inhibitor of mtor (the target of rapamycin in mammals) which is a potent regulator of growth and proliferation of tumor cells, endothelial cells, fibroblasts and smooth muscle cells of the blood vessel wall, reduces glycolysis and angiogenesis of solid tumors in vivo and thus offers two independent mechanisms of tumor growth inhibition: a direct antineoplastic activity in the cells and an inhibition of the tumor stromal compartment.

Risk in Pregnancy	c
0.2	
	Adverse effects

Stomatitis, rash, fatigue, asthenia, diarrhea, anorexia, nausea, mucositis, vomiting, cough, peripheral edema, infections, skin dryness, epistaxis, pruritus, dyspnea, Hypertriglyceridemia, thrombocytopenia, pleural effusion, hypercholesterolemia, hyperlipidemia.

Hypersensitivity to the drug, to other derivatives of rapamycin.

Interactions

Everolimus is a substrate of CYP3A4 and is also a moderately inhibitory substrate of the drug efflux pump known as P-glycoprotein. Therefore, drugs that affect CYP3A4 or P-glycoprotein may alter the absorption and subsequent elimination of Everolimus.

Avoid with live microorganism vaccines.

Take contraceptive measures and up to 8 months after treatment. Cyclosporine increases the bioavailability of Everolimus.

Side	Description		Indications	Route of administration and dosage

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Colon and rectal carcinoma.	Intravenous infusion.
	Each vial or vial contains:	Ovarian carcinoma.	Adults and children:
	Fluorouracil 250 mg	Breast carcinoma.	7 to 12 mg/kg body weight/day, for four days, after 3 days 7 to 10 mg/kg body weight for 3 to
010.000.3012.00	Container with 10 vials or vials with 10 mL.	Carcinoma of head and neck.	4 days per 2 weeks. EITHER
	INJECTABLE SOLUTION	Gastric and esophageal carcinoma.	12 mg/kg body weight for 5 days followed one day later by 6 mg/kg body weight, only 4 to 5 doses, for a

	Each vial or vial contains:	Distance	total of two weeks.
010.000.6220.00	Fluorouracil 500 mg. Container with vial and vial with 10 mL of diluent.	Bladder carcinoma. Liver carcinoma. Pancreatic carcinoma.	Maintenance dose 7 to 12 mg/kg body weight, every 7 to 10 days or 300 to 500 mg/m2 of body surface every 4 to 5 days monthly.
010.000.6220.01	Container with vial and/or vial with 500 mg of lyophilisate without diluent.		It should not exceed 800 mg/day or in very sick patients 400 mg/day.
010.000.6220.02	Container with 10 vials		The dose and route of administration must be adjusted at the discretion of the specialist.
010.000.6220.03	Container with 5 vials		
010.000.6220.04	Container with 25 vials		

Generalities

Specific antimetabolite of the S phase of the cell cycle. It inhibits DNA synthesis, which causes unbalanced growth that is not compatible with cellular life, so it dies.

Leukopenia, thrombocytopenia, pancytopenia, aphthous stomatitis, nausea, vomiting, diarrhea, alopecia, hyperpigmentation, anginal crises, ataxia, nystagmus, dermatosis, disorientation, weakness, drowsiness, euphoria.

Contraindications: Hypersensitivity to the drug.

Precautions: In malnutrition, bone marrow depression, recent surgery, kidney failure and serious infection.

Interactions

Adverse effects increase with medications that produce myelosuppression and with radiotherapy.

FLUTAMIDE

Clue	Description	Indications	Route of administration and dosage
010.000.5426.00	TABLE T Each tablet contains: Flutamide 250 mg Container with 90 tablets.	Treatment of stage D2 metastatic prostatic carcinoma in combination with luteinizing hormone-releasing hormone analogues such as leuprolide acetate.	Oral. Adults: 250 mg orally every 8 hours. The dose and route of administration must be adjusted at the discretion of the specialist.
		Generalities	1

Competitive androgen antagonist that interferes with testosterone activity and complements the medical castration produced by leuprolide.

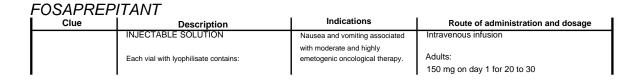

Risk in Pregnancy	d

Adverse effects

Diarrhea, nausea, vomiting, impotence, loss of libido. edema, hypertension, gynecomastia, hot flashes, drowsiness, confusion, elevated liver enzymes, hepatitis. erythema, photosensitivity.

With warfarin the anticoagulant effect increases.

	Fosaprepitant dimeglumine equivalent to 150 mg. of fosaprepitant.	minutes, starting 30 minutes before chemotherapy.
010.000.6023.00	Container with a vial.	
010.000.6023.01	Container with 10 vials.	

Generalities

Fosaprepitant dimeglumine is a water-soluble prodrug of aprepitant. A selective NK1 receptor antagonist in combination with a 5HT3 receptor antagonist and a corticosteroid to prevent nausea and vomiting induced by moderate and highly emetogenic chemotherapy.

Risk in Pregnancy	с
-------------------	---

Adverse effects	

Hiccups, elevation of alanine, aminotransferase, dyspepsia, constipation, headache and decreased appetite.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: There are limited data in patients with moderate hepatic impairment and no data in patients with severe hepatic impairment. Fosaprepitant should be used with caution in these patients.

Fosaprepitant should be used with caution in patients who are concomitantly receiving active substances metabolized mainly through CYP3A4 and with a narrow therapeutic range, such as cyclosporine,

tacrolimus, sirolimus, everolimus, alfentanil, diergotamine, ergotamine, fentanyl and quinidine. Furthermore, action must be taken with particular caution when coadministered with irinotecan because this combination may cause increased toxicity.

Particular caution should be taken when fosaprepitant is administered concomitantly with active substances that are inhibitors of CYP3A4 activity (e.g. ketoconazole, itraconazole, voriconazole, posaconazole, clarithromycin, telithromycin, nefazodone and protease inhibitors), since combination is expected

cause an increase in plasma concentrations of aprepitant.

Interactions

As a weak inhibitor of CYP3A4, fosaprepitant 150 mg single dose may cause a transient increase in plasma concentrations of coadministered active substances that are metabolized through CYP3A4. Total exposure of CYP3A4 substrates may increase up to approximately 2-fold per day.

1 and 2 after coadministration with a single dose of fosaprepitant 150 mg. Fosaprepitant should not be used concomitantly with pimozide, terfenadine, astemizole or cisapride. Fosprepitant inhibits CYP3A4, which may cause an increase in plasma concentrations of these active ingredients, potentially causing serious or life-threatening adverse reactions. Special care should be taken during the concomitant administration of fosaprepitant and active substances that are mainly metabolized through CYP3A4 and with a narrow therapeutic range, such as cyclosporine, tacrolimus, sirolimus, everolimus, alfentanil, diergotamine, ergotamine, fentanyl and quinidine

The dose of oral dexamethasone on days 1 and 2 should be reduced by approximately 50% when coadministered with fosaprepitant 150 mg on day 1 to achieve dexamethasone exposures similar to those obtained when administered without fosaprepitant 150 mg. Fosaprepitant 150 mg, administered as a single intravenous dose

on day 1, the AUC0-24 h of dexamethasone, a CYP3A4 substrate, increased by 100% on day 1, 86% on day 2, and 18 % on day 3, when dexamethasone was coadministered as a single oral dose of 8 mg on days 1, 2, and 3.

Concomitant administration of fosaprepitant with active substances that significantly induce CYP3A4 activity (e.g., rifampicin, phenytoin, carbamazepine, phenobarbital) should be avoided, as the combination may cause decreases in aprepitant plasma concentrations that may lead to a decrease in effectiveness. Concomitant administration of fosaprepitant with herbal preparations containing St. John's Wort (*Hypericum perforatum*, also known as St. John's Wort) is not recommended. Rifampin decreased the terminal half-life of oral aprepitant by 68%.

FULVESTRANT (In prescription monitoring program)

Clue	Description	Indications	Route of administration and dosage

	Container with 30 tablets	
010.000.7109.00 Each ta	blet contains: Ibrutinib 560	
	^{mg} Container with 30 tablets	

Generalities

It is a small molecule, it is a potent inhibitor of Bruton's tyrosine kinase (BTK). Ibrutinib forms a stable covalent bond with a cysteine residue (Cys-481) at the BTK site, thereby generating sustained inhibition of its enzymatic activity. BTK is a key signaling molecule of the B cell receptor complex that plays a critical role in the survival of malignant B cells. Additionally, Ibrutinib affects three key processes in malignant B cells, which are promoting apoptosis, inhibiting adhesion, and modulating chemotaxis.

Risk in Pregnancy	d
-------------------	---

Adverse effects

Diarrhea, fatigue, nausea, peripheral edema, dyspnea, constipation, upper respiratory tract infection, vomiting, decreased appetite.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Minor hemorrhagic events, such as confusion, epistaxis, and petechia, and major hemorrhagic events including gastrointestinal bleeding, intracranial hemorrhage, and hematuria. Infections including sepsis, bacterial, viral or fungal infections. Neutropenia, thrombocytopenia and anemia. Atrial fibrillation and flutter handset.

IDARUBICIN

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Myeloblastic leukemia	Slow intravenous (10 to 15 minutes).
		acute.

IPILIMUMAE	3 (In prescriptior	ו contrc	ol program)		

Clue Description Indications Route of administration and dosage NJECTABLE SOLUTION Intravenous infusion. Treatment of patients with advanced non resectable or m failure to previouselandment/ithith dacarbazine Adults Each vial contains: or temozolamide. Dose: 3 mg/kg body weight, during Ipilimumab 50 mg 90 minutes, every three weeks, for a total of four doses. 010.000.6016.00 Package with a vial with 10 mL (50 mg/10 mL)

Generalities

Cytotoxic T lymphocyte-associated antigen 4 (CTLA-4) is a key regulator of T cell activity.

Ipilimumab is a CTLA-4 immune checkpoint inhibitor, which blocks inhibitory T cell signals induced through the CTLA-4 pathway and increases the number of effector T cells that are mobilized to direct a targeted immune attack. to T-cells against tumor cells. CTLA-4 blockade can also reduce T-cells with regulatory function that could contribute to the anti-tumor immune response. Ipilimumab could selectively decrease regulatory T cells in the tumor area, allowing an increase in the intratumoral ratio of effector T cells/regulatory T cells that would therefore lead to the death of tumor cells.

Risk in Pregnancy	с

Adverse effects

Severe symptoms (abdominal pain, severe diarrhea or significant change in the number of bowel movements, blood in the stool, gastrointestinal bleeding, gastrointestinal perforation). Severe elevations in aspartate aminotransferase (AST), alanine aminotransferase (ALT), or total bilirubin or symptoms of hepatotoxicity. Life-threatening skin rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) or severe generalized pruritus that interferes with activities of daily living or requires medical intervention. New or worsening severe motor or sensory neuropathy. Serious adverse reactions in the endocrine glands, such as hypophysitis and thyroiditis that are not adequately controlled with hormone replacement therapy or high-dose immunosuppressive therapy. Nephritis, pneumonitis, pancreatitis, non-infectious myocarditis.

Contraindications: Hypersensitivity to the drug.

Precautions: Ipilimumab is associated with inflammatory adverse reactions that occur due to increased or excess immune activity (adverse reactions related to the immune system), probably related to its mechanism of action. Immune-related adverse reactions, which may be serious or life-threatening, may involve the gastrointestinal system, liver, skin, nervous system, endocrine system, or other organ systems. Although most immune-related adverse reactions occurred during the induction period, they have also been reported to occur months after the last dose of ipilimumab. Unless an alternative etiology has been identified, diarrhea, increased stool frequency, bloody stools, PFH elevations, rash, and endocrinopathy should be considered inflammatory and related to ipilimumab. Early diagnosis and appropriate management are essential to minimize life-threatening complications.

High-dose systemic corticosteroids with or without additional immunosuppressive treatment may be necessary to

the management of serious immune-related adverse reactions.

Interactions

Ipilimumab is a human monoclonal antibody that is not metabolized by cytochrome P450 (CYP) enzymes or other drug-metabolizing enzymes. A drug interaction study was conducted with ipilimumab administered alone or in combination with chemotherapy (dacarbazine or paclitaxel/carboplatin) to evaluate the interaction with CYP isoenzymes (specifically CYP1A2, CYP2E1, CYP2C8, and CYP3A4) in patients with naïve advanced melanoma. any treatment. No relevant pharmacokinetic interactions were observed between ipilimumab and paclitaxel/carboplatin, dacarbazine or its metabolite, 5-aminoimidazole-4-carboxamide (AIC).

The use of systemic corticosteroids should be avoided at baseline, prior to starting treatment with ipilimumab, due to their potential interference with the pharmacodynamic activity and efficacy of ipilimumab.

It is known that the use of anticoagulants increases the risk of gastrointestinal bleeding. Since gastrointestinal bleeding is an adverse reaction of ipilimumab, patients requiring anticoagulant treatment concomitant use should be carefully monitored.

IRINOTECAN

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Colon and rectal cancer metastatic.	Intravenous infusion.
	The vial contains: Irinotecan hydrochloride or irinotecan	metastatic.	Adults:
	hydrochloride trihydrate 100 mg		125 mg/m2 body surface area/day.
010.000.5444.00	Container with a 5 mL vial.		
		Generalities	

Prevents the synthesis of DNA chains.

Risk in Pregnancy	x
	Adverse effects

Neutropenia, leukopenia, thrombocytopenia, diarrhea, nausea, vomiting, asthenia, fever, liver function disorders, alopecia, rashes.

Contraindications: Hypersensitivity to the drug and uncontrolled infections.

Precautions: Assess risk benefit in patients with anti-infective treatment, or with leukopenia and thrombocytopenia.

Interactions

Laxatives favor gastrointestinal effects. With other antineoplastics, myelosuppression increases, with dexamethasone lymphocytopenia and hyperglycemia can increase, and with diuretics it can cause dehydration.

IXAZOMIB

Clue	Description	Indications	Route of administration and dosage
	Ixazomib Citrate 5.70 mg	Indicated in combination	Oral
	equivalent to 4.0 mg of ixazomib	with lenalidomide and	
		dexamethasone for the treatment	The recommended starting dose of ixazomib is 4 mg
	Collective box with 3 capsules. Each	of patients with multiple myeloma	administered orally once weekly on days 1, 8, and 15 of
	capsule is contained in a bubble wrap sealed in a cardboard wallet, inside an	who have received at least one prior therapy	a 28-day treatment cycle.
10.000.6314.00	individual box.		The first dose reduction of ixazomib due to adverse events is 3 mg and the second reduction is 2.3 mg.

Ixazomib is a reversible proteasome inhibitor. Ixazomib preferentially binds to and inhibits the chymotrypsin-like activity of the beta 5 subunit of the 20S proteasome.

Ixazomib induced apoptosis of several types of tumor cells in vitro. Ixazomib has demonstrated in vitro cytotoxicity against myeloma cells from patients who had relapsed after multiple prior treatments, including bortezomib, lenalidomide, and dexamethasone. The combination of Ixazomib and lenalidomide showed synergistic cytotoxic effects in multiple myeloma cell lines. In vivo, Ixazomib showed antitumor activity in a mouse multiple myeloma tumor xenograft model, including multiple myeloma models.

Risk in Pregnancy X

Adverse effects	
Upper respiratory tract infection, herpes zoster, thrombocytopenia, peripheral neuropathies, di vomiting, rash, back pain, peripheral edema.	arrhea, constipation, nausea,
L Contraindications and Precautions Hypersensitivity to the drug or some of the excipients. Since Ixazomib is administered in comb	
dexamethasone; See the contraindications of each of these drugs. Pregnancy, breastfeeding a age. Thrombocytopenia, gastrointestinal toxicities.	and children under 18 years of

Interactions

Avoid concomitant administration of Ixazomib with strong CYP3A inducers (such as rifampin, phenytoin, carbamazepine, and St. John's wort).

LAPATINIB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	TABLET	Patients with cancer	Oral.
		advanced metastatic breast.	
	Each tablet contains:		Adults.
	Lapatinib ditosylate equivalent to 250 mg	Co-administer with	1250 mg every 24 hours. It should be taken at least one
	lapatinib.	capecitabine to patients whose tumors	hour before or one hour after food.
		over-express ErbB2+ (HER2+) and	
010.000.5421.00	Package with 70 tablets.	prior who have received	
		treatment including trastuzumab.	

Generalities

Lapatinib, a 4-anilinoquinazoline, is an inhibitor of the intracellular tyrosine kinase domains of the EGFR (ErbB1) and HER2 (ErbB2) receptors (estimated Ki app values of 3Nm and 13Nm, respectively) with a slow elimination rate from these receptors. (half-life greater than or equal to 300 minutes). Lapatinib inhibits ErbB-mediated tumor cell growth in vitro and in several animal models.

Risk in F	regnancy C
	Adverse effects

Anorexia, insomnia, headache, decreased left ventricular ejection fraction, diarrhea, nausea, vomiting, dyspepsia, stomatitis, constipation, abdominal pain, hyperbilirubinemia, hepatotoxicity, rash, dry skin, palmar-plantar erythrodysesthesia, alopecia, pruritus, joint disorders nails including paronychia, pain in extremities, back pain, arthralgia, fatigue, mucosal inflammation, asthenia.

Contraindications: Hypersensitivity to the drug.

Γ

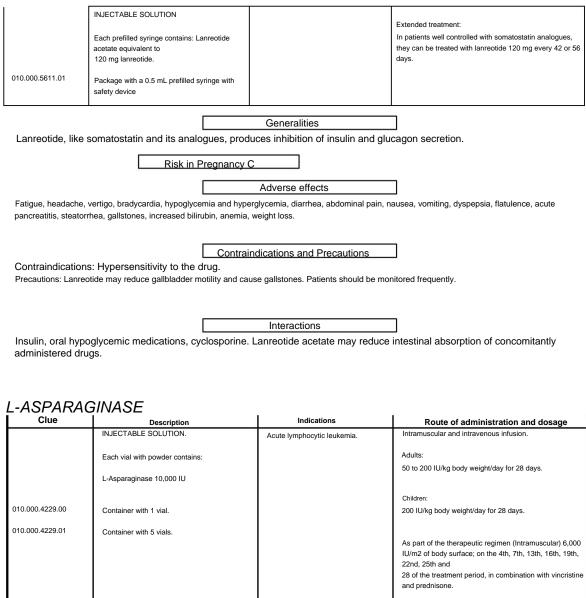

Precautions: Patients with diseases: that affect the function of the left ventricle, that cause a prolongation of the QTc interval, with symptoms of pulmonary toxicity, with liver failure, with kidney failure.

5.	Interactions	

With strong CYP3A4 inhibitors, such as ritonavir, saquinavir, telithromycin, ketoconazole, itraconazole, voriconazole, posaconazole, nefazodone. With CYP3A4 inducers, such as rifampicin, rifabutin, carbamazepine, phenytoin or *Hypericum perforatum*. Lapatinib is a substrate for the transport proteins Pgp and BCRP. Inhibitors (ketoconazole, itraconazole, quinidine, verapamil, cyclosporine, erythromycin) and inducers (rifampicin, St. John's wort) of these proteins may alter the exposure and distribution of lapatinib. Treatment together with substances that increase gastric pH should be avoided, because it may decrease the solubility and absorption of lapatinib.

LANREOTID

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Acromegaly and neuroendocrine tumors	Deep subcutaneous.
	Each prefilled syringe contains: Lanreotide		Adults:
	acetate equivalent to 90 mg lanreotide.		Acromegaly. 60 to 120 mg every 28 days. Neuroendocrine tumors.
			Initial dose: 60 to 120 mg every 28 days.
010.000.5610.01	Package with a 0.5 mL prefilled syringe with safety device		If the response is insufficient, the dose can be adjusted to
			120 mg every 28 days.

In both cases, adjust the dose to the patient's age and conditions. Administer diluted in intravenous solutions packaged in glass bottles.

Generalities

It fractionates asparaginase into aspartic acid and ammonium, an action that interferes with protein synthesis and the formation of DNA and RNA.

Risk in Pregnancy		с
	Adverse	effects

Anorexia, nausea, vomiting, abdominal pain, severe allergic reactions, hepatotoxicity, renal failure, leukopenia, added infections, thrombosis, intracranial hemorrhage.

Contraindications: Hypersensitivity to the drug, chickenpox, herpes zoster, liver or kidney dysfunction and uncontrolled systemic infections.

Precautions: Assess risk benefit in alcoholic and breastfeeding patients.

Interactions

With vincristine, prednisone, immunosuppressants and radiation, its toxicity increases. Interferes with the effect of methotrexate.

LENALIDOMIDE (In prescription monitoring program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Refractory multiple	Oral.
		myeloma.	Refractory multiple myeloma
	Each capsule contains:	Myelodysplastic syndrome with	25 mg every 24 hours, on days 1 to 21 of repeated 28-
	Lenalidomide 10 mg	low/intermediate-risk 5q deletion-1	day cycles.
010.000.5617.00			
010.000.5617.00	Container with 21 capsules.		Deverse there are 10 mm and 14 hours are down 4.4
			Dexamethasone 40 mg every 24 hours on days 1-4,
			9-12 and 17-20 of each 28-day cycle for the first 4 treatment cycles, thereafter 40 mg each
			treatment cycles, thereafter 40 mg each
			24 hours on days 1-4 every 28 days.
	CAPSULE		Adjust dose for toxicities
			hematological during treatment, according to the guide
	Each capsule contains:		attached to the packaging.
	Lenalidomide 15 mg		
010.000.5618.00	Container with 21 capsules.		Myelodysplastic syndrome with low/intermediate-risk 5q
010.000.3010.00	Container with 21 capsules.		deletion-1
	CAPSULE		Starting dose: 10 mg once daily on days 1-21 of 28-day repeat treatment cycles.
	Each capsule contains:		repear treatment cycles.
	Lenalidomide 25 mg		
	Lenandomide 25 mg		
010.000.5619.00	Container with 21 capsules.		
		I	
		Generalities]
Lenalidomide ha	s immunomodulatory, antiang	giogenic and antineoplastic propertie	S.

Alterations of the hematopoietic system, alterations in skin and subcutaneous tissues, gastrointestinal alterations, thrombocytopenia and neutropenia.

Contraindications: Hypersensitivity to the drug. Pregnancy, women with gestational capacity who do not comply with contraceptive methods of a pregnancy prevention program, lactation.

Precautions: No formal studies have been carried out in patients with renal failure. This medication is excreted by the kidneys, and the risk of adverse reactions may be greater in patients with damaged kidneys.

Interactions

It does not interact through the cytochrome P450 pathway, it does not interact with Warfarin, when it is necessary to use digoxin, perform periodic evaluations of serum levels of digoxin.

LENVATINIB (In prescription monitoring program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Treatment of patients with Locally advanced or metastatic	Oral.
	Each capsule contains:	progressively differentiated thyroid cancer	Adults:
	Lenvatinib mesylate equivalent to 4 mg	refractory to radioactive iodine.	Thyroid cancer:
	lenvatinib		The recommended daily dose is 24 mg (two 10 mg
			capsules and one 4 mg capsule), taken once every
010.000.6171.00	Container with 30 capsules.		
	CAPSULE		24 hours.
	Each capsule contains: Lenvatinib mesylate equivalent to 10 mg Ienvatinib		The daily dose should be modified as required according to the dose/toxicity management plan.
010.000.6172.00			
I	Container with 30 capsules.		l I
		Generalities	

Lenvatinib is a receptor tyrosine kinase (RTK) inhibitor that selectively inhibits the kinase activities of the vascular endothelial growth factor (VEGF) receptors, VEGFR1 (FLT1), VEGFR2 (KDR), and VEGFR3 (FLT4), in addition to other RTKs related to pro-angiogenic and oncogenic pathways, including growth factor (FGF) receptors FGFR1, 2, 3 and 4; as well as the platelet-derived growth factor (PDGF) receptor PDGFRÿ; KIT; and RET.

Risk in Pregnancy	x
	Adverse effects

Lymphopenia, thrombocytopenia, heart failure, QT prolongation, hypothyroidism, abdominal pain, increased amylase, constipation, diarrhea, dry mouth, dyspepsia, flatulence, gastrointestinal perforation and fistula, increased lipase, nausea, oral pain, pancreatitis, stomatitis, vomiting, asthenia, peripheral edema, fatigue, malaise, cholecystitis, hepatotoxicity, urinary tract infection, weight loss, decreased appetite, dehydration, hypercholesterolemia, hypocalcemia, hypokalemia, hypomagnesemia. arthralgia, back pain, musculoskeletal pain, myalgia, extremity pain, dizziness, dysgeusia, headache, posterior reversible leukoencephalopathy syndrome, insomnia, proteinuria, kidney failure, renal failure, cough, dysphonia, pulmonary embolism, alopecia , hyperkeratosis, palmar-plantar erythrodysesthesia syndrome, redness, arterial thromboembolic events, hemorrhage, hypertension, hypotension.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Hypertension: Hypertension has been reported in patients treated with Lenvatinib. Proteinuria: Proteinuria has been reported in patients treated with lenvatinib. Monitor urine protein regularly. Renal Failure and Insufficiency: Events of renal failure (including renal failure) have been reported in patients treated with lenvatinib. Heart Failure: Heart failure and decreased left ventricular ejection fraction have been reported in patients treated with lenvatinib. Hemorrhagic events: Serious bleeding events have been reported in patients treated with lenvatinib. Hypocalcemia has been reported in patients treated with lenvatinib. Hypocalcemia has been reported in patients treated with lenvatinib.

Monitor blood calcium levels periodically and replace calcium as needed during treatment with lenvatinib.

Interactions

Effect on Cytochrome P450 or UGT Enzymes: Lenvatinib is not considered a strong inducer or inhibitor of cytochrome P450 or uridine 5-diphosphoglucoronosyl transferase (UGT) enzymes.

LETROZOLE

Clue	Description	Indications	Route of administration and dosage
	DRAGEE OR TABLET	Breast cancer	Oral.
		advanced with	
	Each dragee or tablet contains: Letrozole	postmenopausal status.	Adults:
	2.5 mg		
			One dragee every 24 hours.
010.000.5541.00	Package with 30 dragees or tablets.		
		Generalities]
Highly selective i biosynthesis of other	nhibitor of aromatase, a KEY enzyme steroid hormones.	in the biosynthesis of estroc	gens, without modifying the

Risk in Pregnancy	х

Adverse effects Headache, nausea, malleolar edema, fatigue, alopecia, erythematous and maculopapular rash, vomiting, dyspepsia, weight gain, musculoskeletal pain, anorexia.

	Contraindications and Precautions
Contraindications: Hypersensitivity to the	drug, premenopausal and in minors.
Precautions: Use with caution in severe re	enal failure and liver failure.

Interactions

Because it is an isoenzyme inhibitor, it should be administered with caution in patients taking medications that are transformed in the liver.

LEUPRORELIN

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SUSPENSION	palliative treatment of	Intramuscular.
		advanced prostate	A student
	Each vial with lyophilized microspheres contains:	cancer.	Adults:

Gonadotropin-rel	easing hormone agonist.		
	Risk in Pregnancy	d	
		ŭ	
	A	dverse effects	
Hot flashes hurn	ing at the application site fatigue testicu	lar atrophy and avpacomastia	

Hot flashes, burning at the application site, fatigue, testicular atrophy and gynecomastia.

As with any LHRH analogue, a transient increase in serum testosterone concentration is possible during the first week of treatment. Therefore, exacerbation of signs and symptoms of the disease during the first weeks of treatment is to be expected in patients with spinal metastases and/or urinary obstruction or

hematuria. If these conditions worsen they can lead to neurological problems such as: weakness and paresthesia of the lower limbs or exacerbation of urinary symptoms.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Cautions: Changes in bone mineral density may occur during any hypoestrogenic state. Loss of bone mineral density may be reversible after discontinuation of leuprorelin acetate.

Leuprorelin Acetate has not been studied in women or children. It is known that Leuprorelin can cause fetal damage, therefore, it is contraindicated in pregnancy and lactation.

Leuprorelin Acetate 45 mg is contraindicated in pediatric patients.

Interactions	

No pharmacokinetic studies have been performed on the risk of interaction with other drugs. Its particular pharmacological behavior and low binding to plasma proteins mean that negative interactions are not expected.

LEVAMISOL

Clue	Description	Indications	Route of administration and dosage
	TABLET	Adjuvant in	Oral.
		colon carcinoma	
	Each tablet contains:	chemotherapy.	Adults:
	Levamisole hydrochloride equivalent to 50 mg.		Initial dose: 50 mg every 8 hours for three days.
	of levamisole.		
010.000.5502.00	Package with 2 tablets.		Sustaining dose: 50 mg every 8 hours for 2 weeks.
		Conorolition	1

Immunomodulator that stimulates the formation of antibodies by stimulating T lymphocytes and the proliferation of neutrophil macrophage monocytes. The primary indication is to treat patients with surgically treated colon adenocarcinoma in stage C as an adjuvant to 5-Fluorouracil. It has anthelmintic activity against ascaris and pinworms.

Risk in Pregnancy	С
Nok in Programoy	

Nausea, diarrhea, dermatitis, fatigue, arthralgia, drowsiness, leukopenia, vomiting.

Γ

Contraindications and Precautions

Adverse effects

Contraindications: Hypersensitivity to the drug, agranulocytosis, anemia, leukopenia, presence of HLA B27 in rheumatoid arthritis.

Interactions

With alcohol it produces a disulfiram effect and with warfarin it increases the prothrombin time. Increases the plasma concentration of phenytoin.

LIPEGFILGRASTIM (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Duration reduction	Subcutaneous.
		of neutropenia in adult	
	Each prefilled syringe contains:	patients with malignant	Adults:
	Lipegfilgrastim 6 mg	tumors treated with cytotoxic	6 mg for each cycle of chemotherapy.
		chemotherapy (with the exception	Administer 24 hours after cytotoxic chemotherapy.
010.000.6120.00	Package with 1 prefilled syringe with 6 mg/0.6	of chronic myeloid leukemia and	
	mL (with cap and without safety cap).	syndromes	
		myelodysplastic).	

Generalities

Lipegfilgrastim is a covalent conjugate of filgrastim, human G-CSF, which is a glycoprotein that regulates the production and release of functional neutrophils from the bone marrow. Lipegfilgrastim is a sustained-acting form of filgrastim due to reduced renal clearance. Lipegfilgrastim binds to the human G-CSF receptor, as do filgrastim and pegfilgrastim.

Risk in Pregnancy

Adverse effects

х

Musculoskeletal pain, thrombocytopenia, hypokalemia, chest pain, headache, erythema and belching.

Contraindications and Precautions

Contraindications and Precautions: Hypersensitivity to the drug. Do not use in patients with chronic myeloid leukemia and myelodysplastic syndromes.

Interactions

Concomitant use of lipegfilgrastim with any chemotherapy drug has not been evaluated in patients.

In vitro data indicate that lipegfilgrastim has little or no effect or activity on CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, and CYP3A5, therefore, lipegfilgrastim is not likely to affect metabolism by human cytochrome P450 enzymes.

	Description	Indications	Route of administration and dosage
	CAPSULE	Brain cancer.	Oral.
	Each bottle with two capsules contains:	Hodgkin's disease.	Adults and children:
	Lomustine 10 mg Lomustine 40 mg		130 mg/ m2 body surface, as single dose every 6 weeks.

ERIBULIN MESYLATE

Clue	Description	Indications	Route of administration and dosage
010.000.6082.00	INJECTABLE SOLUTION Each vial contains: Eribulin mesylate 1,130 mg Container with vial bottle with 1 mg/ 2 mL of solution.	For the treatment of adult patients with locally advanced or metastatic breast cancer with disease progression after at least one chemotherapy regimen for advanced disease. Prior therapy must have included an anthracycline and a taxane in the adjuvant or metastatic setting unless these treatments were not appropriate for the patients.	Intravenous Adults 1.4 mg/m2 of body surface, during 2 to 5 minutes, on days 1 and 8 of each 21-day cycle.

Generalities

Eribulin Mesylate is a first-class halichondrin B-based inhibitor of microtubule dynamics. It is a structurally simplified synthetic analogue of halichondrin B, a natural product isolated from the marine sponge Halichondria okadai.

Eribulin inhibits the growth phase of microtubules without affecting the shortening phase and sequesters tubulin in non-productive aggregates. Eribulin exerts its effects through a tubulin-based antimitotic mechanism that results in G2/M cell cycle block, disruption of mitotic spindles finally, apoptotic death after prolonged and irreversible mitotic block.

Eribulin mesylate also affects the tumor microenvironment and tumor phenotype through mechanisms that are not linked to its antimitotic effects. These additional effects of Eribulin include: (i) remodeling of the tumor vasculature whereby the internal tumor cores are better perfused and less hypoxic and (ii) the phenotypic changes from more aggressive mesenchymal phenotypes to less aggressive epithelial phenotypes of the reversal of the epithelial-mesenchymal transition.

Risk in Pregnancy

Women of childbearing potential should be informed to avoid becoming pregnant while they or their partners are receiving Eribulin mesylate and to use effective contraception during and for up to 3 months after completing treatment.

There is no information on the use of eribulin mesylate in pregnant women. Eribulin mesylate is embryotoxic, phenotoxic and teratogenic in rats. Eribulin mesylate should not be used during pregnancy unless clearly necessary and after careful consideration of the needs of the mother and the risk to the fetus.

There is no information on the excretion of eribulin mesylate or its metabolites in human or animal breast milk. However, the risk for newborns or infants cannot be excluded, so eribulin mesylate should not be used during breast-feeding.

Adverse effects

Neutropenia, leukopenia, anemia, febrile neutropenia, lymphopenia, thrombocytopenia, peripheral neuropathy, headache, dysgeusia, dizziness, anxiety, depression, insomnia, increased lacrimation, asthenia/fatigue, mucosal inflammation, pyrexia, peripheral edema, pain, constipation, diarrhea, nausea, vomiting, stomatitis, dry mouth, dyspepsia, abdominal pain, aspartate aminotransferase increased, alanine aminotransferase increased, gamma glutamyl transferase increased, hyperbilirubinemia, arthralgia/myalgia back pain, bone pain, leg pain extremities, muscle spasm, muscle weakness, weight loss, decreased appetite, hypokalemia, hypomagnesemia, hypocalcemia, dehydration, cough, dyspnea, alopecia, rash, rash, pruritus, sepsis, pneumonia, upper respiratory tract infection, urinary tract infection , drug hypersensitivity, hepatitis, pancreatitis, interstitial lung disease, Stevens-Johnson syndrome, toxic epidermal necrolysis.

Contraindications and Precautions

Contraindications: hypersensitivity to the drug or to the components of the formula. Pregnancy and breastfeeding. General precautions:

Hematology

Myelosuppression is dose-dependent and manifests primarily as neutropenia. Febrile neutropenia occurred in patients treated with eribulin mesylate.

Complete blood chemistry monitoring should be performed before each dose in all patients receiving eribulin mesylate.

Patients with febrile neutropenia, severe neutropenia or thrombocytopenia should be treated according to recommendations.

Patients with alanine aminotransferase (ALT) or aspartate aminotransferase (AST) > 3 X ULN (upper limit of normal) They had a higher incidence of grade 4 neutropenia and febrile neutropenia. Although data are limited, patients with bilirubin >15 x ULN also have a higher incidence of grade 4 neutropenia and febrile neutropenia.

Peripheral neuropathy

Monitor patients closely for signs of peripheral and sensory neuropathy. Peripheral neuropathy should be treated by delaying and adjusting the dose according to recommendations.

QT interval prolongation

Drug and other interactions

In an uncontrolled open-label ECG study in 26 patients, QT prolongation was observed on day 8, regardless of eribulin concentration, with QT prolongation not observed on day 1. ECG monitoring is recommended if treatment is initiated in patients with heart failure. congestive heart disease, bradyarrhythmias, treatments with medications known to prolong the QT interval, including class Ia and III antiarrhythmics, and electrolyte disturbances. Correct hypocalcemia or hypomagnesia before initiating treatment with eribulin mesylate, and monitor these electrolytes periodically during therapy. Treatment with eribulin mesylate should be avoided in patients with congenital long QT syndrome.

Effects on ability to drive and use machines.

Eribulin may cause side effects such as tiredness and dizziness which may have a mild or moderate influence on the ability to drive or use machines. Patients should be advised not to drive or use machines if they feel tired or dizzy.

Interactions	

No drug interactions are expected with CYP3A4 inhibitors, CYP3A4 inducers, or P-glycoprotein (P-gp) inhibitors. There is no effect on Eribulin exposure (area under the curve AUC) and maximum concentration (Cmax) when Eribulin was administered with or without ketoconazole, a potent CY3A4 inhibitor, or when administered with rifampin, a potent CYP34 inducer.

Eribulin does not inhibit or induce CYP1A2, CYP2C9, CYP2C19, CYP2D6, CYP2E1 or CYP3A4 enzymes. CYP1A2, CYP2C9, CYP2C19 OR CYP3A4 at clinically relevant concentrations.

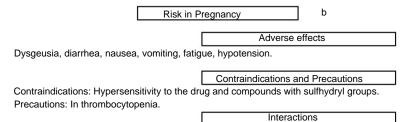

L

MESNA

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION		
		Prophylaxis of	Intravenous.
	Each ampoule or vial contains:	hemorrhagic cystitis in patients	
		receiving ifosfamide or	Adults:
	Mesna 400 mg	cyclophosphamide.	240 mg/m2 body surface area,
			administered together with the antineoplastic.

	Each vial with lyophilisate contains:
	Methotrexate sodium equivalent to
	1g. of methotrexate.
010.000.2194.00	Container with a vial.

Generalities

Folic acid antimetabolite in the S phase of the cell cycle. It inhibits the synthesis of DNA, RNA, thymidylate and proteins and interrupts cell replication. It is moderate as an immunosuppressant.

Risk in Pregnancy	d

Adverse effects

Anorexia, nausea, vomiting, abdominal pain, diarrhea, ulcerations, gastrointestinal perforation, stomatitis, bone marrow depression, liver and kidney failure, pulmonary fibrosis, neurotoxicity.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Assess risk benefit in malnutrition, serious infections, bone marrow depression, immunodeficiency, nephropathy and pulmonary alveolitis.

Interactions

Overdosage requires intravenous calcium folinate. Salicylates, sulfas, phenytoin, phenylbutazone and tetracyclines increase their toxicity. Folic acid reduces its effect.

MIDOSTAURINE

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	In combination with standard With	Oral
		induction and consolidation chemotherapy,	Adults
	Each capsule contains midostaurin	followed by maintenance monotherapy, in adult	
	25 mg.	patients with FLT3 mutation-positive acute	Twice a day with an interval between doses of 12 hours.
		myeloblastic leukemia.	The capsules should be taken with food.
010.000.6285.00	Package with 112 capsules (4 boxes with 28 capsules) of 25 mg.		
	······································		The recommended dose of midostaurin is 50 mg orally twi
			daily.
			It is taken from day 8 to day 21 of the consolidation induction chemotherapy
			cycles, and then, in patients with a complete response, every day in monothera
			maintenance treatment until relapse for 12 cycles of 28 days each. In patients
			receiving a hematopoietic stem cell transplant (HSCT), midostaurin should be
			discontinued 48 hours before Office start of pre-HSCT conditioning treatment.
		1	
	[Generalities	7

Midostaurin is an inhibitor of tyrosine kinases, such as FLT3 and KIT. It inhibits signal transduction by the FLT3 receptor, induces cell cycle arrest and promotes apoptosis in leukemic cells that express mutated ITD or TKD receptors or that overexpress normal receptors.

Ris	sk in Pregnancy	
Should not be administered during pregnancy		
		-
	Adverse effects	
Upper respiratory tract infection, neutrop	etic sepsis, febrile neutropenia, petechiae,	lymphopenia, hyperse

Upper respiratory tract infection, neutropetic sepsis, febrile neutropenia, petechiae, lymphopenia, hypersensitivity, hyperuricemia, insomnia, headache, syncope, tremor, eyelid edema, hypotension, tachycardia, hypertension, pericardial effusion, epistaxis, laryngeal pain, nausea, vomiting, stomatitis, epigastralgia, hemorrhoids, exfoliative dermatitis, hyperhidrosis, back pain, arthralgia, pyrexia, hyperglycemia, prolongation of partial thromboplastin activated time.

Contraindications and Precautions

Neutropenia, infections, cardiac dysfunction, pulmonary toxicity, embryo-fetal toxicity and lactation

Interactions

Midostaurin is extensively metabolized in the liver via the CYP3A4 isoform that is induced or inhibited by a number of concomitant medications. Those drugs that inhibit or induce this family of cytochromes should be monitored.

MIFAMURTIDA

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SUSPENSION	Treatment of	Intravenous.
010.000.5650.00	Each vial contains: Mifamurtide 4 mg Container with vial bottle with powder.	Non-metastatic resectable high- grade osteosarcoma after macroscopically complete surgical resection.	Children, adolescents and adults. 2 mg/m2 body surface. Cycle 36 weeks, 2 per week the first
			12 weeks and one per week for the next 24 weeks.

Generalities

Mifamurtide (muramyl tripeptide phosphatidyl ethanolamine, MTP-PE) is a synthetic derivative of muramyl dipeptide (MDP), with immunostimulant effects similar to natural MDP, with the additional advantage of a longer half-life in plasma. Specific ligand for NOD2, a receptor found mainly in monocytes, dendritic cells and macrophages. MTP-PE is a potent activator of monocytes and macrophages. Activation of these cells is associated with the production of cytokines, including tumor necrosis factor (TNF-alpha), interleukin-1 (IL-1beta), IL-6, IL-8, and IL-12, and adhesion molecules. , including lymphocyte **function** -associated antigen 1- (LFA-1) and intercellular adhesion molecule-1 (ICAM-1).

Anemia, leukopenia, headache, dizziness, anorexia, tachycardia, dyspnea, cough, vomiting, diarrhea, myalgia, arthralgia, fever and asthenia.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Children < 2 years. During pregnancy and lactation Precautions: History of: autoimmune, inflammatory or other collagen-related diseases; of venous thrombosis, vasculitis, unstable cardiovascular disorders, asthma, or other chronic obstructive diseases.

It should be prescribed and supervised only by a specialist doctor.

Interactions

Simultaneous use with cyclosporine or other calcineurin inhibitors. Simultaneous use with high-dose non-steroidal antiinflammatory drugs (NSAIDs, cyclooxygenase inhibitors).

MYTHOMYCIN

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Stomach cancer.	Intravenous.
	Each vial with powder contains:	Pancreatic cancer.	Adults:
	Mitomycin 5 mg	Colon cancer.	2 mg/m2 of body surface area, intravenously/ daily for five days or 10 to 20 mg/m2 body surface as a single dose.
010.000.3022.00	Container with a vial.	Lung cancer.	20 mg/mz body sunace as a single dose.
		Breast cancer.	Treatment will be suspended if the leukocyte count is less than 3,000/mm3 or if the platelets are below 75,000/mm3.
Generalities			

It forms cross-links between DNA helices, which inhibits DNA synthesis. It also inhibits the synthesis of RNA and proteins to a lesser extent.

	Risk in Pregnancy	d	
	Adverse effe	cts	
	enia. Nausea, vomiting, diarrhea, sto nia, uremic syndrome, renal failure.	omatitis, dermatitis, fever and malaise, pulm	onary fibrosis
		cyte counts less than 3,000/mm3 , platelets l	ess than
75,000/mm3 or serum creatinin	le levels above 1.7 mg/100 mL.		

With myelosuppressive medications, adverse effects increase. Dextran and urokinase enhance the cytotoxic action of the drug.

MITOXANTRONE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Non-Hodgkin lymphomas.	Intravenous infusion.
	Each vial contains: Mitoxantrone hydrochloride equivalent to 20 mg	Acute granulocytic leukemias.	Adults:
	of mitoxantrone base.	Breast cancer.	8 to 14 mg/m2 body surface, each 21 days.
010.000.4233.00	Container with a 10 mL vial.		Children:
			8 mg/m2 of body surface area/day, per 5 days.
			Administer diluted in intravenous solutions packaged in glass bottles.
1			
		Generalities	

Antiproliferative in slow and fast growing tissues, it stimulates the formation of breaks in DNA strands, an action mediated by topoisomerase II.

Contraindications: Hypersensitivity to the drug, liver or kidney failure, cardiomyopathy.

Interactions

Adverse effects increase with myelosuppressive medications and radiotherapy.

MOLGRAMOSTIM

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Myelosuppressive therapy.	Subcutaneous or intravenous infusion.
	Each vial with lyophilisate contains:	Aplastic anemia.	Adults:
	Molgramostim 400 µg	Neutropenia.	1 to 3 μg/kg/day. The maximum daily dose should not exceed 10 mg/kg day.
010.000.5429.00	Package with a vial and a one mL vial with	Bone marrow transplant.	
	diluent.		The duration of treatment depends on the therapeutic
			response.
			Administer diluted in intravenous solutions
			packaged in glass bottles.
2.19		 *	
		Generalities	1

It is an essential protein that intervenes in the regulation of hematopoiesis and leukocyte functional activity. Stimulates colonies of granulocytes and macrophages.

Risk in Pregnancy

	Adverse effects	
Fever, bone pain, rash, dyspnea, nausea	, muscle pain, hypotension and fatigue.	
	Contraindications and Precautions	
Contraindications: Hypersensitivity to the	drug.	
Precautions: History of autoimmune thrombocytopenic purpura.		
	Interactions	
Thrombocytopenia may occur with cytoto	xic drugs.	

NILOTINIB (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	myeloid leukemia	Oral.
	Each capsule contains:	chronic positive for Philadelphia chromosome, resistance with or intolerance to previous imatinib. treatment, including	Adults:
	Nilotinib hydrochloride equivalent to 200 mg of nilotinib.	imatinid. treatment, including	400 mg every 12 hours.
010.000.4322.00 010.000.4322.01	Container with 112 capsules. Container with 120 capsules.		It should be administered at least 2 hours before food and no food should be consumed one hour after the dose.
	·	Generalities	- 1

Bcr-Abl kinase inhibitor. It inhibits the proliferation of leukemic cell lines derived from patients with Filadelmia chromosomepositive chronic myeloid leukemia.

Risk in Pregnancy		d
	Adverse effects	

Anorexia, alopecia, erythema and asthenia, urticaria, pruritus, nausea, headache, fatigue, constipation, diarrhea, generalized bone pain, arthralgia, muscle spasms and peripheral edema. Thrombocytopenia, anemia and neutropenia. Pleural effusion, pericardial effusion, gastrointestinal and central nervous system bleeding. Pneumonia, urinary tract infections, hypercalcemia, insomnia, anxiety, taste disturbance, QT prolongation, and decreased visual acuity.

Contraindications and Precautions

Contraindications: Known hypersensitivity to nilotinib or any of its excipients. Myelosuppressed patients. Serious uncontrolled infections.

Precautions: In patients who develop myelosuppression during treatment, biweekly or monthly hematological monitoring and temporarily reduce or suspend treatment. In patients who have or may develop QT prolongation. Correct hypomagnesemia and hypokalemia before starting treatment. Avoid grapefruit juice and other foods that inhibit CYP3A4. Severe lactose or galactose intolerance. Patients with liver failure.

Interactions

Avoid concomitant use with strong CYP3A4 inhibitors such as ketoconazole, itraconazole, voriconazole, clarithromycin or ritonavir, which prolongs the QT interval.

NIVOLUMAB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	PD-L1 biomarker-positive (ÿ10%) metastatic non-squamous non-small cell lung cancer showing progression during or	Intravenous.
	Each vial contains:	after platinum-based chemotherapy.	Adults:
	Nivolumab 100 mg		3 mg/kg body weight administered intravenously infused ovein60 minutes every
			two weeks until disease progression or
010.000.6109.00	Container with a vial with 10 mL of	Patients with EGFR or ALK tumor genetic alterations must	unacceptable toxicity.
	solution (10 mg/mL).	have experienced disease progression with therapy for these	
а. — — — — — — — — — — — — — — — — — — —		alterations before receiving treatment.	
	INJECTABLE SOLUTION		
	Each vial contains:	Metastatic squamous histology non-small cell lung cancer that	
	Nivolumab 40 mg		

010.000.6110.00 Container with a vial with 4 mL of solu	shows progression during or after platinum-based chemotherapy.
ingrinc).	Treatment of patients with unresectable or metastatic melanoma in first line with or without ipilimumab for unresectable or metastatic melanoma.
	Treatment of patients with Classical Hodgkin Lymphoma who have relapsed or progressed after an autologous hematopoietic progenitor cell transplant and who present failure after the use of post-transplant b ^o fentuximab vedotin.
	Recurrent or metastatic squamous head and neck cancer with disease progression or after platinum-based therapy.

Generalities

Binding of the PD-1 ligands, PD-L1 and PD-L2, to the PD-1 receptor found on T cells inhibits T cell proliferation and cytokine production. Increased PD-1 ligands occur in some tumors and signaling through this pathway may contribute to the inhibition of tumor immune surveillance by active T cells. Nivolumab is a human immunoglobulin G4 (IgG4) monoclonal antibody that binds to the PD-1 receptor and blocks its interaction with PD-L1 and PD-L2, releasing inhibition of the immune response mediated by the PD-1 pathway. , including the antitumor immune response.

Adverse effects

Pneumonitis, colitis, hepatitis, nephritis, rash, encephalitis and immunologically mediated endocrinopathies.

Contraindications and Precautions

Contraindications and Precautions: Hypersensitivity to the drug.

Interactions

No formal drug interaction study has been performed with nivolumab.

OBINUTUZUMAB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	In combination with Chlorambucil is indicated for the treatment	Chronic lymphocytic leukemia
	Each vial contains:	of patients with chronic lymphocytic leukemia (CLL) without prior treatment.	Intravenous infusion
	Obinutuzumab 1000 mg		Adults: 1000 mg on days 1, 8 and 15 of the first 28-day treatment cycle.
010.000.6037.00	Container with vial bottle with 40 mL (1000 mg/40 mL).	In combination Bendamustine, with	followed by 1000 mg administered on day 1 only in each subsequent treatment cycle (cycles 2-6).
		followed by maintenance Obinutuzumab is indicated for the with	
		treatment of follicular lymphoma (FL) patients who did not respond or had progression during 생i볇trer treatment with rituximab or a regimen that included rituximab.	On day 1, 100 mg is administered at a rate of 25 mg/h in 4 hours. If the patient tolerates it, the rest of the dose can be infused this same day or on day 2, 900 mg is administered and it can be increased by 50 mg/h every 30 minutes to a maximum rate of 400 mg/h.
			On days 8, 15, and day 1 of subsequent cycles, administer 1000 mg at a rate of 100 mg/h and increase in increments of 100 mg/h every 30 minutes to a maximum rate of 400 mg/h.
			On days 8, 15, and day 1 of subsequent cycles, administer 1000 mg at a rate of 100 mg/h and increase in increments of 100 mg/h every 30 minutes to a maximum rate of 400 mg/h.
			Refractory/recurrent follicular lymphoma (at a

The recommended dose of Obinutuzumab is
1000 mg administered on days 1, 8 and 15 of the first 28-day treatment cycle, followed by 1000 mg administered on day 1 only of each subsequent treatment cycle (cycles 2 to 6)
Bendamustine is administered IV on days 1 and 2 in cycles 1 to 6 at 90 mg/m2/day.
Patients who respond to induction treatment (first 6 cycles) should continue Obinutuzumab 1000 mg as maintenance therapy every 2 months for 2 years.
Generalities

Obinutuzumab is a recombinant monoclonal antibody CD20 type II and IgG1 isotype, humanized and modified by glucoengineering. It acts specifically against the extracellular domain of the transmembrane antigen CD20 present on the surface of pre-B and mature B lymphocytes. The modification of the FC fragment of obinutuzumab by glucoengineering determines that the affinity of this antibody for the Fc_iRIII receptors present on effector immune cells such as natural killer (NK) lymphocytes and macrophages and monocytes is greater than that of antibodies not subjected to said modification. It induces direct cell death and mediates antibody-dependent cellular cytotoxicity (ADCC) and antibody-dependent cellular phagocytosis (ADCF) through the recruitment of effector cells of the immune system that express FcÿRIII receptors.

Risk in Pregnancy c

Adverse effects

The most frequent adverse reactions reported are reactions at the infusion site, cases of tumor lysis syndrome have been reported in patients with high tumor burden, neutral and thrombocytopenia that should be part of the routine monitoring of patients, and those with heart disease. The presence of arrhythmias should be monitored. Reactivation of hepatitis B has been described.

Contraindications and Precautions

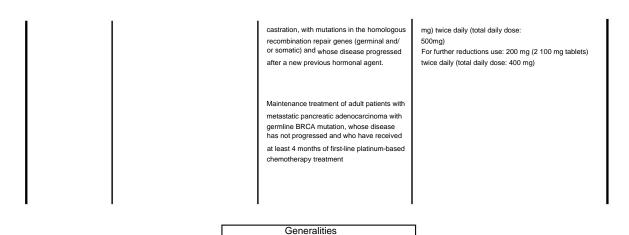

It is contraindicated in patients with known hypersensitivity (IgE-mediated) to Obinutuzumab or any of the excipients.

Interactions

No formal drug interaction studies have been conducted. A risk of interactions with concomitantly used medications cannot be excluded.

OL	AP.	AR	IΒ
----	-----	----	----

Clue	Description	Indications	Route of administration and dosage
	TABLET Each tablet contains: Olaparib 100 mg	Monotherapy for the maintenance treatment of adult patients with high-grade serous epithelial ovarian cancer, fallopian tube cancer, or peritoneal cancer	Oral. Adults: 400 mg twice a day.
010.000.6358.00	Cardboard box with 56 tablets of 100 mg each	primary, recurrent platinum with sensitivity containing BRCA mutation (germline and/or somatic), responding (complete or partial response) to platinum-	Patients should initiate treatment with olaparib no later than 8 weeks after completion of their last administration of the platinum-containing regimen.
010.000.6359.00	TABLET Each tablet contains: Olaparib 150 mg Cardboard box with 56 tablets of 150 mg each	based chemotherapy. Monotherapy for the treatment of adult patients with metastatic triple-negative breast cancer with germline BRCA mutation, who have been previously treated with chemotherapy.	Adults: 300 mg twice a day Patients should initiate treatment with olaparib no later than 8 weeks after completion of their last administration of the platinum-containing regimen.
		Treatment of adult patients with refractory metastatic prostate cancer	Initial dose reduction: 250 mg (one 150 mg tablet and one 100 mg tablet

Active inhibitor of Poly (ADP-ribose) polymerase (PARP). When olaparib is bound to the active site of PARP, it prevents dissociation from the DNA, becoming trapped, thus blocking the repair of the genetic material of tumor cells with mutation in BRCA1 or BRCA2, the accumulation of damage activates cell death exclusively of malignant cells. In normal cells, alternative pathways are used to repair DNA double-strand breaks.

Risk in Pregnancy

d

Adverse effects

Gastrointestinal toxicities are common, generally grade (1 and 2). Antiemetic prophylaxis is not required. Anemia, thrombocytopenia, neutropenia and lymphopenia are generally low grade (1 and 2), however there are reports of grade 3 and major events. Baseline testing is recommended, followed by monthly monitoring for the first 12 months and periodically thereafter.

Contraindications and Precautions

Contraindications: Hypersensitivity to the active substance or any of its excipients.

Precautions: Myelodysplastic syndrome (MDS), acute myeloid leukemia (AML), pneumonitis, due to its mechanism of action it could cause embryo-fetal toxicity when administered to a pregnant woman, so it should not be used during pregnancy and in women of childbearing age. who do not use reliable contraceptive methods (during

treatment and 1 month after the last dose) and breastfeeding (during treatment and 1 month after the last dose). Asthenia, fatigue and dizziness have been reported and those patients experiencing these symptoms should exercise caution when driving or using machines.

Interactions	
interactione	

It is not recommended for use in combination with other antineoplastic agents (myelosuppressive activity may be potentiated or prolonged) and requires caution if coadministered with immunosuppressants or vaccines (due to potential pharmacodynamic interactions).

Coadministration of olaparib with strong CYP3A inducers or inhibitors should be avoided.

ONDANSETRON

Clue	Description	Indications	Route of administration and dosage
	TABLET	Nausea and vomiting secondary to	Oral.
	Each tablet contains: Hydrochloride	antineoplastic	Adults:
	ondansetron dihydrate	chemotherapy	One tablet every 8 hours, one to two hours before
	equivalent to 8 mg of ondansetron.	and radiotherapy.	radiotherapy. The treatment can be for five days.
010.000.2195.00	Package with 10 tablets.		Children over four years old: Half a tablet every eight hours for five days.
	INJECTABLE SOLUTION		Slow intravenous or infusion.
	Each vial or vial contains:		Adults:
	Hydrochloride dihydrate		One vial, 15 minutes before chemotherapy. Repeat at 4 and 8 hours

	ondansetron equivalent to 8 mg ondansetron.		after the first dose.
010.000.5428.00	Container with 3 vials or vials with 4 mL.		Intravenous infusion: 1 mg/hour up to 24 hours.
			Children over four years old: 5 mg/m2 of body surface, for fifteen minutes immediately before chemotherapy. Administer diluted in intravenous solutions packaged in glass bottles.

Headache, diarrh	ea, constipation and hypersensitivity re	eactions.	
Contraindications	Contraindio	cations and Precautions]
Contrainfulcations			

Precautions: Assess risk benefit in breastfeeding.

Interactions

Inducers or inhibitors of the hepatic microsomal enzyme system modify its transformation.

OSIMERTINIB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	TABLET Each tablet contains: Mesylate Osimertinib equivalent to 80 mg osimertinib	Second line of treatment of adult patients with locally advanced or metastatic epidermal growth factor receptor (EGFR) mutation-positive non- small cell lung cancer (NSCLC)	Oral. Adults: 80 mg once daily until disease progression or unacceptable toxicity.
010.000.6173.00	Package with 30 tablets.	T790M, after progression to EGFR tyrosine kinase inhibitors (TKI).	

Generalities

Osimertinib irreversibly inhibits epidermal growth factor receptors that harbor the T790M mutation, providing significant clinical benefit in patients with this mutation who have been previously treated with TKIs.

Risk in Pregnancy	С
-------------------	---

Adverse effects

Diarrhea, stomatitis, rash, dry skin, paronychia, pruritus, keratitis, interstitial lung disease, QT prolongation.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: EGFR T790M mutation status should be determined. A validated test should be performed using either tumorderived DNA from a tissue sample or circulating tumor DNA obtained from a plasma sample.

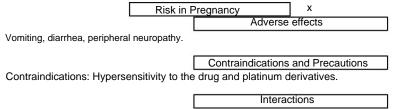

Interactions

Do not administer simultaneously with St. John's wort.

OXALIPLATIN

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Colon and rectal cancer metastatic.	Intravenous infusion.
	Each vial contains: Oxaliplatin		Adults:
	50 mg.		
010.000.5458.00	Package with a vial with lyophilisate or package with a vial with 10 mL.		130 mg/m2 of body surface, in 250 to 500 mL for 2 to 6 hours, every 21 days.
			Administer diluted in intravenous solutions packaged in
	INJECTABLE SOLUTION		glass bottles.
	Each vial contains: Oxaliplatin 100 mg.		
010.000.5459.00	Package with a vial with lyophilisate or package with a vial with 20 mL.		
	INJECTABLE SOLUTION		
	Each vial contains: Oxaliplatin 100 mg.		
010.000.5459.01	Box with 10 vials		
		Generalities	ๅ

Cytotoxic antineoplastic agent belonging to the group of platinum derivatives and whose mechanism of action is the formation of covalent bonds, within and between the chains of the DNA molecule.

With concomitant administration with raltitrexed, the clearance of oxaliplatin increases and its terminal half-life decreases.

PACLITAXEL

At the cellular level, it stabilizes microtubules and promotes the union of tubulin dimers, to prevent their

depolymerization.
Risk in Pregnancy X
Adverse effects
Anemia, thrombocytopenia, leukopenia, hepatotoxicity, bradycardia, hypotension, dyspnea, nausea, vomiting, alopecia and peripheral neuropathy.
Contraindications and Precautions
Contraindications: Hypersensitivity to the drug and medications formulated with polyoxytylated castor oil. Precautions: Assess risk benefit in neutropenia.
Interactions
With cisplatin, etoposide, carboplatin and fluorouracil, myelotoxicity increases. With ketoconazole its effect decreases.

PALBOCICLIB (In prescription control program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE OR TABLET Each capsule or tablet contains: Palbociclib 75 mg	Cancer treatment metastatic breast with hormone receptor positive and HER2 negative in combination	Oral. Adults: One 125 mg capsule every 24 hours, for 3 weeks followed by 1 week off.
010.000.6142.00	Cardboard box with 21 capsules or tablets.	with Fulvestrant in post-menopausal women with	by I week on.
	CAPSULE OR TABLET	failure to previous treatment with non-steroidal aromatase inhibitors.	This regimen is repeated until progression or treatment failure.
	Each capsule or tablet contains: Palbociclib 100 mg		Doses can be decreased to 100 mg or 75 mg based on individual safety and tolerability.
010.000.6143.00	Cardboard box with 21 capsules or tablets.	Cancer treatment advanced/	
	CAPSULE OR TABLET Each capsule or tablet contains: Palbociclib 125 mg	metastatic breast with hormone receptor positive and HER2 negative in combination with Letrozole	When administered concomitantly with palbociclib, the recommended dose of fulvestrant is 500 mg administered intramuscularly on days 1, 15, 29 and once monthly every 28 days.
010.000.6144.00	Cardboard box with 21 capsules or tablets.	as initial endocrine therapy in postmenopausal women.	When administered concomitantly with palbociclib the recommended dose of letrozole is 2.5 mg taken orally once daily continuously during the 28-day cycle.

Generalities

Palbociclib is a small molecule taken orally and is a highly selective inhibitor of cyclin-dependent kinases (CDK) 4 and 6. Through inhibition of CDK 4/6, Palbociclib reduced cell proliferation by blocking cell progression from the G1 phase to the S phase of the cell cycle to slow tumor progression in patients with hormone receptor-positive HER2- cancer.

The most common adverse effects (incidence ÿ10%) were neutropenia, leukopenia, fatigue, anemia, upper respiratory tract infection, nausea, stomatitis, alopecia, diarrhea, thrombocytopenia, decreased appetite, vomiting, asthenia, peripheral neuropathy, and epistaxis.

Hypersensitivity to Palbociclib or any component of the formula, in pregnancy and lactation, under 18 years of age. Monitor complete blood count prior to initiation of therapy and at the beginning of each cycle, as well as on day 14 of the first two cycles, and as clinically indicated to prevent and manage near-series neutropenia. Monitor signs and symptoms and withhold dosage as appropriate for infections. May cause fetal harm. Counsel patients about the potential risk to the fetus and about using effective contraception.

Interactions

Palbociclib is primarily metabolized by CYP3A and the sulfotransferase (SULT) enzyme SUTL2A1. CYP3A inhibitors increase the plasma concentrations of Palbociclib, therefore their concomitant use should be avoided. CYP3A inducers reduce Palbociclib plasma concentrations, therefore concomitant use of strong CYP3A inducers with Palbociclib should be avoided.

PALONOSETRON

Clue	Description	Indications	Route of administration and dosage	
010.000.4437.00	INJECTABLE SOLUTION Each vial contains: Palonosetron hydrochloride equivalent to 0.25 mg of palonosetron. Container with a 5 mL vial.	Prevention of nausea and Acute and delayed vomiting after chemotherapy and radiotherapy.	Intravenous. Adults: 0.25 mg. Single dose administered as a bolus over a period of 30 seconds, 30 minutes before the start of chemotherapy.	
Generalities Antiemetic and anti-nausea agent, selective antagonist of the serotonin receptor subtype 3 (5HT3). Risk in Pregnancy b				
Adverse effects Headache and constipation, diarrhea, dizziness, fatigue, abdominal pain, insomnia. Contraindications and Precautions				
	s: hypersensitivity to the drug.		ac conduction intervals, particularly QTc	

Interactions

The potential for clinically significant interactions appears to be very low. In controlled clinical studies it has been safely administered with corticosteroids, analgesics, antiemetics/antinausea, antispasmodics and anticholinergic agents. It does not inhibit the antitumor activity of chemotherapeutic agents.

PALONOSETRON / NETUPITANT

Clue	Description	Indications	Route of administration and dosage
	CAPSULE Each capsule contains: Netupitant 300 mg Palonosetron hydrochloride equivalent to 0.5 mg of palonosetron.	Prevention of nausea and Acute and delayed vomiting associated with initial and repeated courses of moderately and highly emetogenic cancer chemotherapy.	Oral. Adults: Administer one capsule approximately one hour before starting each chemotherapy cycle.
010.000.6174.00	Container with 1 capsule.		

Generalities

Netupitant acts as a selective antagonist of human substance P neurokinin 1 (NK1) receptors. On the other hand, palonosetron is a 5-HT3 receptor antagonist with a strong binding affinity to this receptor and little or no affinity to other receptors.

Headache, constipation and fatigue.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: The medication may cause constipation, serotonin syndrome, QT prolongation.

Netupitant may significantly increase dexamethasone exposure in a dose- and time-dependent manner. Exposure to docetaxel and etoposide increased by 37% and 21%, respectively, when administered together with palonosetron/netupitant. Cases of serotonin syndrome have been reported after concomitant use of

5-HT3 antagonists and other serotonergic medications (selective serotonin reuptake inhibitors and serotonin and norepinephrine reuptake inhibitors, among others).

PANITUMUMAB

INJECTABLE SOLUTION Treatment for patients with metastatic colorectal cancer, with non-mutated (wild) Intravenous. Each vial contains: patients with metastatic colorectal cancer, with non-mutated (wild) Adults: Panitumumab 100 mg KRAS in combination chemotherapy 6 mg/kg body weight administered by intravenous infusion, once every two weeks. 010.000.5653.00 Container with vial bottle with 5 mL. with (Second line) or as monotherapy after failure of standard chemotherapy.	Clue	Description	Indications	Route of administration and dosage
Each vial contains: cancer, with non-mutated (wild) Adults: Panitumumab 100 mg KRAS in combination chemotherapy 6 mg/kg body weight administered by intravenous infusion, once every two 010.000.5653.00 Container with vial bottle with 5 mL. with (Second line) or as monotherapy after failure of		INJECTABLE SOLUTION		Intravenous.
	010.000.5653.00	Panitumumab 100 mg	cancer, with non-mutated (wild) KRAS in combination chemotherapy FOLFOX (First line), FOLFIRI with (Second line) or as monotherapy after failure of	6 mg/kg body weight administered by intravenous infusion, once every two

Generalities

Panitumumab is a fully human IgG2 recombinant monoclonal antibody, which binds with high affinity and specificity to human EGFR. EGFR is a transmembrane glycoprotein that belongs to a subfamily of type I tyrosine kinase receptors, which includes EGFR (HER1/c-ErbB-1), HER2, HER3, and HER4. EGFR enhances cell growth in normal epithelial tissues, including skin and hair follicles, and is expressed in a variety of tumor cells.

Risk in Pregnancy		d
	Adverse effects	

Paronychia, pustular rash, cellulitis, folliculitis, localized infection, anemia, leukopenia, Hypokalemia, anorexia, hypomagnesemia, hypocalcemia, dehydration, hyperglycemia, hypophosphatemia, insomnia, anxiety, headache, dizziness, conjunctivitis, blepharitis, eyelash growth, increased lacrimation, ocular hyperemia, xerophthalmia, ocular pruritus, eye irritation, tachycardia, deep vein thrombosis, hypotension, hypertension, flushing, dyspnea, cough, pulmonary embolism, epistaxis, diarrhea, nausea, vomiting, abdominal pain, stomatitis, constipation, rectal bleeding, mouth dry, dyspepsia, aphthous stomatitis, cheilitis, gastroesophageal reflux disease, dermatitis acneiform, rash, erythema, pruritus, dry skin, skin fissures, acne, alopecia, palmar-plantar erythrodysesthesia syndrome, skin ulcer, scab, hypertrichosis, onychoclasia, nail disorders, back pain, pain in the extremities, Fatigue, pyrexia, asthenia, mucosal inflammation, peripheral edema, chest discomfort, pain, chills, weight loss, decrease in magnesium in the blood.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Patients with interstitial pneumonitis or pulmonary fibrosis. The combination of Panitimumab with oxaliplatin-containing chemotherapy is contraindicated in patients with *KRAS*- mutated mCRC or in whom *KRAS* status in mCRC is unknown.

Precautions: Dermatologic reactions, a pharmacologic effect seen with epidermal growth factor receptor (EGFR) inhibitors, occur in nearly all patients (approximately 90%) treated with Panitumumab. Patients with a history or signs of interstitial pneumonitis or pulmonary fibrosis were

excluded from clinical trials. Cases of interstitial lung disease (ILD) have been reported, with outcomes mortal and non-fatal. Progressive decreases in serum magnesium levels leading to severe hypomagnesemia (grade 4) have been observed in some patients. Patients should be periodically monitored for the development of hypomagnesemia and associated hypocalcemia before initiating treatment with Panitumumab. Acute renal failure has been observed in patients who develop severe diarrhea and dehydration. Patients experiencing severe diarrhea should be instructed to consult a healthcare professional urgently.

Interactions

Panitumumab should not be administered in combination with IFL-containing chemotherapy or with combinations of bevacizumab and chemotherapy. A high incidence of severe diarrhea has been observed when panitumumab was administered in combination with IFL and an increase in toxicity and deaths was observed when panitumumab was combined with bevacizumab and chemotherapy.

The combination of Panitumumab with oxaliplatin-containing chemotherapy is contraindicated in patients with *KRAS*-mutated mCRC or in whom the *KRAS* status in mCRC is unknown. A decrease in progression-free survival and overall survival was observed in a clinical trial in patients with *KRAS*- mutated tumors who received panitumumab and FOLFOX.

PAZOPANIB (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	TABLET	Patients with advanced or	Oral.
		metastatic renal cell carcinoma	
	Each tablet contains:		Adults:

010.000.5654.00	Pazopanib hydrochloride equivalent to 200 mg. of Pazopanib. Package with 30 tablets.	First line	800 mg once a day. It should be taken without food (at least one hour before or two after a meal). It should be taken whole with water and should not be broken or crushed.
-----------------	--	------------	---

Generalities

Orally administered Pazopanib is a potent tyrosine kinase inhibitor (TKI) that inhibits multiple Vascular Endothelial Growth Factor Receptors (VEGFR)-1, -2 and -3, inhibits platelet-derived growth factor receptors (PDGFR).)-ÿ and –ÿ, and inhibits the stem cell factor receptor (c-KIT), with IC50 values of 10, 30, 47, 71, 84 and 74 nM, respectively.

Transient ischemic attack, ischemic stroke, myocardial ischemia, myocardial infarction and cerebral infarction, heart failure, gastrointestinal perforation and fistula, QT prolongation and pulmonary, gastrointestinal and cerebral hemorrhage, venous thromboembolic events, left ventricular dysfunction and pneumothorax. Fatal events possibly related to pazopanib included gastrointestinal bleeding, pulmonary hemorrhage/hemoptysis, abnormal liver function, intestinal perforation, and ischemic stroke. The most common adverse reactions of any grade included: diarrhea, changes in hair color, skin hypopigmentation, exfoliative rash, hypertension, nausea, headache, fatigue, anorexia, vomiting, dysgeusia, stomatitis, decreased weight, pain, elevations of alanine aminotransferase and aspartate aminotransferase.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Hepatic effects, hypertension, posterior reversible encephalopathy syndrome (PRES)/reversible posterior leukoencelopathy syndrome (RPLS), cardiac dysfunction/heart failure, QT prolongation and Torsade de Pointes, arterial thrombotic events, venous thromboembolic events, microangiopathy

thrombosis, hemorrhagic events, gastrointestinal perforations and fistula, hypothyroidism, proteinuria, pneumothorax, infections,

Interactions

Inhibitors of CYP3A4, P-gp, BCRP, inducers of CYP3A4, P-gp, BCRP, concomitant use of pazopanib and simvastatin, concomitant administration of pazopanib with esomeprazole decreases the bioavailability of pazopanib by approximately 40% (AUC and Cmax),

PEGASPARGASA

Clue	Description	Indications	Route of administration and dosage
010.000.6335.00	SOLUTION Each vial contains: Pegaspargase 3,750 IU Excipient cbp 5 ML Cardboard box with a vial of 3,750 IU in 5 mL (750 IU/mL)	Component of a Multi-agent chemotherapy regimen for the first-line treatment of pediatric patients with acute lymphoblastic leukemia with hypersensitivity to native forms of L- asparaginase.	Parenteral (Intravenous infusion) or intramuscular The recommended dose in pediatric patients with a body surface area (BSA) < 0.6 m2 is 82.5 U (equivalent to 0.1 mL) / Kg of body weight every 14 days. The recommended dose for pediatric patients with BSA ÿ 0.6 m2 and ÿ 21 years of age is 2500 U (equivalent to 3.3 mL) / m2 BSA every 14 days.

Generalities

Antineoplastic agent and immunomodulatory agent. L-asparaginase is an enzyme that catalyzes the conversion of the amino acid L-asparagine to aspartic acid and ammonia. The mechanism of action is based on the selective destruction of leukemic cells due to the depletion of exogenous plasma L-asparagine. Leukemic cells with low expression of asparagine synthetase have a reduced ability to synthesize L-asparagine and are therefore dependent on an exogenous source of asparagine for their survival. However, normal cells, due to their ability to synthesize L-asparagine, are less affected by the depletion of plasma L-asparagine.

Risk in Pregnancy	x
	Adverse effects

Anaphylactic reaction, alanine aminotransferase increased, aspartate aminotransferase increased, blood bilirubin increased, hypoalbuminemia, febrile neutropenia, blood fibrinogen decreased, hyperglycemia, lipase increased, pancreatitis, hypoglycemia, embolism, hypersensitivity.

Contraindications and Precautions

History of anaphylactic or severe hypersensitivity reactions to the active substance or any of the excipients, history of severe thrombosis during previous treatment with asparaginase, history of pancreatitis, including pancreatitis related to previous therapy with asparaginase, history of serious bleeding events during prior asparaginase therapy; severe liver failure.

Interactions	

No formal drug interaction studies have been performed between pegaspargase and other medications. The following drug interactions have been observed with other asparaginase products, and may occur with pegaspargase: a) effects on protein-bound drugs, b) effects with concomitant use of other chemotherapeutic agents: immediate or concomitant treatment with vincristine may increase the pegaspargase toxicity. Therefore, vincristine should be administered in a timely manner before administration of pegaspargase in order to minimize toxicity, c) effects on the metabolism and clearance of other drugs, d) effects on live vaccines.

PEGFILGRASTIM

Clue	Description	Indications	Route of administration and dosage		
	INJECTABLE SOLUTION	stimulating factor	Subcutaneous.		
		granulocyte colonies.			
	Each prefilled syringe contains:		Adults and people over 18 years of age:		
	Pegfilgrastim 6 mg				
			6 mg for each cycle of chemotherapy		
010.000.5452.00	Package with a prefilled syringe with 6 mg/0.60 mL.		applied 24 hours after it.		
Generalities					
Granulocyte colony-stimulating factor. Stimulates the proliferation, differentiation and functional activity of granulocytes.

Bone pain, myalgia, arthralgia, nausea, v	omiting, dyspnea, cough, hypersensitivity re	actions, splenomegaly.		
	Contraindications and Precautions			
Contraindications: Hypersensitivity to the	medication.			
Precautions: In patients with acute leukemia, since efficacy and safety have not been investigated in these patients.				
	Interactions			

None of clinical importance.

PEMBROLIZUMAB (In Catalog II program)

		Route of administration and dosage
Each vial contains: w Pembrolizumab 100 mg tu 010.000.6153.00 Container with a vial with 4 mL of solution (100 mg/4 mL). 56	ine of patient treatment with metastatic non-small cell lung cancer NSCLC) whose tumors express PD-L1 with umor expression ratio score (TPS) > 50% determined by a validated test, without EGFR and ALK tumor genomic aberrations.	Intravenous. Adults: Dose: 200 mg administered as an intravenous a infusion for 30 minutes every 3 weeks or 400 mg every 6 weeks until disease progression or unacceptable toxicity.

Generalities

Pembrolizumab is a humanized IgG4 monoclonal antibody of recombinant DNA origin expressed in Chinese hamster ovary (CHO) cells. Pembrolizumab has a high affinity against PD-1, PD-1 is an immune control receptor that limits the activity of T lymphocytes in peripheral tissues. The PD-1 pathway is an immune checkpoint that can be compromised by tumor cells to inhibit immune surveillance of active T cells. Pembrolizumab exerts a double ligand blockade of the PD-1 pathway, including PD-L1 and PD-L2, in

antigen-presenting or tumor cells. By inhibiting the PD-1 receptor from binding to its ligands, Pembrolizumab reactivates tumor-specific cytotoxic T lymphocytes in the tumor microenvironment and reactivates antitumor immunity.

Risk in Pregnancy	d
Adverse effects	

Pneumonitis, colitis, hepatitis, nephritis, hypophysitis, type 1 diabetes mellitus, hypothyroidism, hyperthyroidism and severe immunemediated skin reactions may occur.

I Contraindications and Precautions		Contraindications and Precautions
-------------------------------------	--	-----------------------------------

Contraindications: It is contraindicated in patients with hypersensitivity to any of the components of the formula, in pregnancy or lactation.

General Precautions: Immune-mediated adverse reactions: Immune-mediated adverse reactions occurred in patients receiving Pembrolizumab. In clinical studies, the majority of immune-mediated adverse reactions were reversible and manageable with discontinuation of pembrolizumab, administration of

corticosteroids and/or supportive care. Immune-mediated adverse reactions may occur simultaneously

affecting more than one body system, such as: Immune-mediated pneumonitis, Immune-mediated colitis, Immune-mediated hepatitis, Immune-mediated nephritis, Immune-mediated endocrinopathies Severe skin reactions immune-mediated.

Infusion-related reactions: Hypersensitivity and anaphylaxis have been reported.

	Interactions		
I pharmacokinetic drug interaction studies have been performed.			

PEMETREXED

No forma

Clue	Description	Indications	Route of administration and dosage

	equivalent to 500 mg of pemetrexed.		
			Administer diluted in intravenous solutions
010.000.5453.00	Container with vial bottle.		packaged in glass bottles.

Generalities

Antineoplastic agent, antifolates, which exerts its action by interrupting folate-dependent metabolic processes, essential for cell replication.

Risk in Pregnancy	с
	Adverse effects

Anemia, leukopenia, neutropenia, nausea, vomiting, anorexia, stomatitis, pharyngitis, diarrhea, constipation, fever, fatigue, transaminasemia, rash and/or skin peeling, pruritus, alopecia, hypersensitivity reactions.

Contraindications: hypersensitivity to the drug. Precautions: pregnancy, myelosuppressive diseases. Fever and neutropenia.

Interactions

Its adverse effects would be increased with bone marrow depressants. When their use is associated with cisplatin, non-steroidal anti-inflammatory drugs should be used with caution.

PERTUZUMAB (In prescription control program)

Clue	Description	Indications /	Route of administration and dosage
	SOLUTION	Patients with HER 2 positive metastatic	Intravenous infusion.
	INJECTABLE	breast cancer without prior exposure to anti-HER treatment, or whose disease has	Adults:
	Each vial	relapsed (with	
	contains:		840 mg administered over 60 minutes, followed by

010.000.6024.00	Pertuzumab 420mg	more than 6 months interval) after adjuvant therapy.	420 mg every 3 weeks. In combination therapy with trastuzumab plus docetaxel.
	Container with vial bottle with 14 mL.	Neo-adjuvant treatment of breast cancer indicated in combination with Trastuzumab and docetaxel for patients with HER2 positive, locally advanced, inflammatory breast cancer or candidate for surgical treatment.	 Neo-adjuvant treatment of breast cancer. Pertuzumab, Trastuzumab and docetaxel should be administered as indicated above as part of one of the following regimens: ÿ For 3 cycles after FEC therapy. ÿ For 6 cycles before FEC therapy. ÿ For 6 cycles with carboplatin (docetaxel dose increase is not recommended above 75 mg/m2) After surgery, patients should be treated with adjuvant Trastuzumab until complete 1 year of treatment.
		Generalities	

Pertuzumab is a recombinant humanized monoclonal antibody directed specifically against the extracellular dimerization domain (subdomain II) of the human epidermal growth factor receptor 2 (HER2) protein, thereby blocking ligand-dependent heterodimerization of HER2 with other members of the HER family, such as EGFR, HER3 and HER4. As a result, Pertuzumab inhibits ligand-initiated intracellular signaling through two important signaling pathways, mitogen-activated protein kinase (MAP) and phosphoinositide 3-kinase (PI3K).

Inhibition of these signaling pathways can cause cell growth arrest and apoptosis, respectively. Additionally, Pertuzumab mediates antibody-dependent cellular cytotoxicity.

Risk in Pregnancy	c
Adverse ef	ffects

Upper respiratory tract infection Nasopharyngitis. Febrile neutropenia, Neutropenia, Leukopenia, Anemia. Hypersensitivity/anaphylactic reaction, infusion reaction/cytokine release syndrome. Decreased appetite, Insomnia. Peripheral neuropathy, Headache, Dysgeusia, cough. Diarrhea, Vomiting, Stomatitis, Nausea, Constipation, Dyspepsia. Alopecia, Exanthema, Nail disorders. Myalgia, Arthralgia.

Contraindications: Hypersensitivity to the drug.

Precautions: Decreases in LVEF have been reported with drugs that antagonize HER2 activity, including Pertuzumab. Patients who have previously received anthracyclines or radiation therapy to the thoracic region may be at increased risk of decreased LVEF.

Pertuzumab has not been studied in patients with: a pre-treatment LVEF value <50%; history of congestive heart failure (CHF); decreases in LVEF to <50% during prior adjuvant treatment with trastuzumab; or processes that may alter left ventricular function such as uncontrolled hypertension, recent myocardial infarction, severe cardiac arrhythmia requiring treatment, or prior cumulative anthracycline exposure > 360 mg/m2 doxorubicin or its equivalent.

Patients treated with Pertuzumab, trastuzumab and docetaxel have a higher risk of febrile neutropenia compared to patients treated with placebo, trastuzumab and docetaxel, especially during the first 3 treatment cycles.

Interactions

No pharmacokinetic interactions have been observed between pertuzumab and trastuzumab, or between pertuzumab and docetaxel in a substudy in 37 patients of the CLEOPATRA randomized pivotal trial in metastatic breast cancer.

laboratory findings.

treatment

х

Dexamethasone 40 mg daily, days 1, 8, 15 and 22 of each 28-day treatment cycle.

Pomalidomide is an oral immunomodulatory agent with direct antimyeloma tumoricidal activity, immunomodulatory activities, and inhibits stromal cell support for the growth of multiple myeloma tumor cells. Specifically, pomalidomide inhibits the proliferation and induces apoptosis of hematopoietic cells. tumors.

Generalities

Risk in Pregnancy

Adverse effects

Anemia, neutropenia, thrombocytopenia, leukopenia, fatigue, fever, peripheral edema, pneumonia, constipation, diarrhea, nausea, bone pain, muscle spasms, dyspnea, cough, decreased appetite.

Contraindications and Precautions				
Contraindications and Precautions: Hypersensitivity to the drug.				

Interactions

Pomalidomide is not anticipated to cause clinically relevant pharmacokinetic drug interactions due to inhibition or induction of enzymes or inhibition of transporters when coadministered with substrates of these enzymes or transporters. The potential for drug interactions, including the potential impact of pomalidomide on oral contraceptive exposure, has not been evaluated clinically.

PONATINIB (In Catalog II program)

Pomalidomide 1 mg

Container with 21 capsules.

010.000.6145.00

Clue `	Description	Indications	Route of administration and dosage
	TABLETS	Chronic myeloid leukemia in chronic phase,	Oral.
		accelerated phase or blast phase	

	Each tablet contains: Ponatinib 45 mg.	resistant to dasatinib or nilotinib or T3I5I mutation	The recommended starting dose is 45 mg once a day.
010.000.6302.00	Package with 30 tablets.	Philadelphia chromo www.pbbs.stic acute leukemia with resistance to desatinib or T3I5I mutation.	

Generalities

Potent pan-BCR-ABL inhibitor with structural elements, such as a carbon-carbon triple bond, that provide high-affinity binding to wild-type BCR-ABL and mutant forms of ABL kinase. Ponatinib inhibits the tyrosine kinase activity of ABL and T315I mutant ABL.

Adverse effects Upper respiratory tract infection, pneumonia, sepsis, folliculitis, cellulitis; anemia, decreased platelet count, decreased neutrophil count, pancytopenia, febrile neutropenia, decreased leukocyte count, decreased lymphocyte count; decreased appetite, hypothyroidism; dehydration, fluid retention, hypocalcemia, hyperglycemia, hyperuricemia, hypophosphatemia, hypertriglyceridemia, hypokalemia, weight loss, hyponatremia; insomnia; headache, dizziness; stroke, cerebral infarction, peripheral neuropathy, lethargy, migraine, hyperesthesia, hypoesthesia, paresthesia, transient ischemic attack; blurred vision, dry eyes, periorbital edema, eyelid edema, conjunctivitis, visual disturbance; heart failure, myocardial infarction, congestive heart failure, coronary artery disease, angina pectoris, pericardial effusion, atrial fibrillation, decreased ejection fraction, acute coronary syndrome, atrial flutter; HTN, peripheral occlusive arterial disease, peripheral ischemia, peripheral arterial stenosis, intermittent claudication, deep vein thrombosis, flushing, hot flashes; dyspnea, cough, pulmonary embolism, pleural effusion, epistaxis, dysphonia, pulmonary hypertension; abdominal pain, diarrhea, vomiting, constipation, nausea, increased lipase; pancreatitis, increased blood amylase, gastroesophageal reflux disease, stomatitis, dyspepsia, abdominal distension, abdominal discomfort, dry mouth, gastric bleeding, increased alanine aminotransferase, increased aspartate aminotransferase, increased blood bilirubin, increased blood alkaline phosphatase, increased gamma-glutamyltransferase; rash, dry skin, pruritic rash, exfoliative rash, erythema, alopecia, pruritus, skin exfoliation, night sweats, hyperhidrosis, petechiae, ecchymosis, skin pain, exfoliative dermatitis, hyperkeratosis, skin hyperpigmentation; bone pain, arthralgia, myalgia, pain in an extremity, back pain; muscle spasms, musculoskeletal pain, neck pain, musculoskeletal chest pain; erectile dysfunction; fatigue, asthenia, peripheral edema, fever; pain, chills, flu-like illness, non-cardiac chest pain, palpable nodule, facial edema.

Contraindications and Precautions

Severe hepatic failure, renal failure with Clcr < 50 mL/min or end-stage renal disease; myelosuppression, arterial occlusion, more common with age and with a history of ischemia, hypertension, diabetes or hyperlipidemia. Do not use with a history of myocardial infarction, previous revascularization or stroke, unless there is a risk benefit. History of pancreatitis or alcoholism.

Interactions

Plasma concentrations increased by: strong CYP3A inhibitors, such as clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, troleandomycin, voriconazole and grapefruit juice.

Plasma concentrations decreased by: strong CYP3A4 inducers, such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampicin and St. John's wort.

Enhances the therapeutic effect and toxicity of: digoxin, dabigatran, colchicine, pravastatin, methotrexate, rosuvastatin, sulfasalazine.

RIBOCICLIE	•					
	Description	1	Indications In	Route of administration and dosage		
	COMPRESSED		Dination with a tase inhibitor, is indicated for the initial	Oral.		
	Each tablet contains:	endocr	rine treatment of pre/perimenopause	Adults:		
	Ribociclib succinate 254 mg equivalent to 200 mg ribociclib	·	enopausal women with advanced metastatic cancer hormone receptor (HR)	3 tablets of 200 mg every 24 hours, in a single dose, for 21 consecutive days, followed by 7 days without		
010.000.6165.00	Package with 63 tablets.		e and human epidermal growth factor or 2 (HER2) negative.	treatment, which completes the 28-day cycle.		
			with	This regimen is repeated until progression or treatment		
			of	failure. Doses can be decreased to 400 mg or		
			-	200 mg based on individual safety and tolerability.		
		Ger	neralities]		

Ribociclib is a selective inhibitor of cyclin-dependent kinases (CDK) 4 and 6. These kinases are activated by binding to cyclins D and play a crucial role in signal transduction pathways leading to cell cycle progression and cell proliferation. Cyclin D-CDK4/6 complexes regulate cell cycle progression through phosphorylation of retinoblastoma-associated protein (pRb). Ribociclib should always be administered in combination with an aromatase inhibitor.

Risk in Pregnancy	c

Adverse effects

Neutropenia, leukopenia, headache, back pain, nausea, fatigue, diarrhea, vomiting, constipation, alopecia, rash, abnormal liver function tests, lymphopenia, hypophosphatemia, and QT prolongation

Contraindications and Precautions

Contraindications: contraindicated in patients with hypersensitivity to the active substance or any of the excipients.

Precautions: Before starting treatment with Ribociclib, a complete blood count should be performed. It will be repeated every 2 weeks during the first 2 cycles, at the beginning of each of the following 4 cycles, and thereafter when there is a clinical indication.

Liver function tests (LFT) should be performed before starting treatment with Ribociclib, every 2 weeks during the first 2 cycles, at the beginning of each of the following 4 cycles, and thereafter when there is a clinical indication.

Before starting treatment, an electrocardiographic evaluation should be carried out. Ribociclib will only be started if the patient has a QTcF interval less than 450 ms. The electrocardiogram (ECG) will be repeated around day 14 of the first cycle, at the beginning of the second cycle, and thereafter when there is a clinical indication.

Interactions

Ribociclib is primarily metabolized by CYP3A and is a time-dependent inhibitor of CYP3A in vivo. Therefore, medications that affect the activity of the CYP3A isomorph may alter the pharmacokinetics of Ribociclib. The simultaneous use of strong CYP3A inhibitors or inducers should be avoided. Coadministration of Ribociclib with medications that may prolong the QT interval should be avoided.

RITUXIMAB

Clue	Description	Indications Non-	Route of administration and dosage
	INJECTABLE SOLUTION	Hodgkin lymphoma.	Intravenous infusion.
010.000.5433.00 010.000.5433.01	Each vial contains Rituximab 100 mg Container with 1 vial with 10 mL. Container with 2 vials with 10 mL.	Chronic lymphocytic leukemia. Rheumatoid arthritis. Granulomatosis with polyangiitis (Wegener's) (GPA) Microscopic Polyangiitis (PAM).	Adults: 375 mg/m2 body surface area/day, every 7 days. Administer diluted in intravenous solutions packaged in glass bottles.
010.000.5445.00 010.000.5445.01	INJECTABLE SOLUTION Each vial contains Rituximab 500 mg Container with a 50 mL vial. Container with two vials with 50 mL each.		

Generalities

Murine/human chimeric monoclonal antibody that binds to the transmembrane antigen CD 2O on B lymphocytes causing immunological reactions.

Risk in Pregnancy	d
	Adverse effects

Nausea, vomiting, fatigue, headache, pruritus, rash, bronchospasm, angioedema, rhinitis, hypotension, flushing, cardiac arrhythmias, exacerbation of angina pectoris or heart failure, thrombocytopenia, neutropenia or anemia.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Г

Precautions: In ischemic heart disease or with myelosuppression.

Interactions

With myelosuppressive medications, its adverse effects increase.

SORAFENIB (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	COMPRESSED	Kidney cancer.	Oral.
	Each tablet contains:	Hepatocellular carcinoma.	Adults:
	Sorafenib tosylate equivalent to 200 mg sorafenib.		400 mg every 12 hours.
010.000.5480.00	Package with 112 tablets.		
	· · · · · · · · · · · · · · · · · · ·	Generalities	1

Inhibitor of serine/threonine kinases and tyrosine kinases, tumor cell receptors and tumor vessel cells, thus inhibiting angiogenesis and tumor proliferation.

Risk in Pregnancy d
Adverse effects
Rash, diarrhea, asthenia and adynamia, fatigue, arterial hypertension.
Contraindications and Precautions
Contraindications: Hypersensitivity to the drug or to any of the components of the medication formulation
Interactions

With compounds that are metabolized and eliminated through the UGT1A1 pathway, such as irinotecan.

SUNITINIB (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	cell carcinoma	Oral.
		metastatic kidney.	
	Each capsule contains:		Adults.
	Sunitinib malate equivalent to	Gastrointestinal stromal	50 mg every 24 hours, for 4 weeks, followed by 2 weeks
	12.5 mg sunitinib.	tumors with resistance	off.
		or intolerance to imatinib.	This regimen is repeated until progression or treatment
010.000.5482.00	Container with 28 capsules.		failure.
			Doses may be increased or decreased in ranges of 12.5
			or 25 mg based on individual safety and tolerance.
	-	Concrelition	

Generalities

It inhibits multiple receptor tyrosine kinases (RTKs) involved in tumor growth, pathological angiogenesis and metastatic progression of cancer. It has great inhibitory activity against platelet-derived growth factor (PDGFRÿ and PDGFRÿ)ÿ vascular endothelial growth factor receptors (VEGFR1, VEGFR2 and VEGFR3), stem cell factor receptor (KIT), tyrosine kinase - 3 (FLT3) similar to Fms, receptor for colony-stimulating factor Type 1 (CSF - 1R) and receptor for glial cell line-derived neurotrophic factor (RET). Its primary metabolite has a potency similar to Sunitinib.

Risk in Pregnancy		d
	Adverse eff	ects

The most severe are: Pulmonary embolism, thrombocytopenia, tumor hemorrhage, febrile neutropenia and arterial hypertension. The most common are: Fatigue, diarrhea, nausea and vomiting, stomatitis, dyspepsia, skin discoloration, dysgeusia and anorexia.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug or to any of the components of the medication formulation.

Interactions

Medications that increase the plasma concentration of Sunitinib: Strong CYP3A4 inhibitors, such as ketoconazole, ritonavir, itraconazole, erythromycin, clarithromycin, grapefruit juice, grape juice.

Medications that decrease the plasma concentration of Sunitinib: CYP3A4 inducers, such as rifampicin,

dexamethasone, phenytoin, carbamazepine, phenobarbital, St. John's wort.

Cide	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Breast cancer, when the Her2Neu	Intravenous infusion.
		oncogene is present.	
	Each vial with powder contains:		Adults:
	Trastuzumab 150 mg		Initial: 4 mg/kg body weight, administered over
			90 min.
010.000.5422.00	Container with vial bottle.		Maintenance: 2 mg/kg of weight, every 7

	INJECTABLE SOLUTION	days.
	Each vial with powder contains:	Administer diluted in intravenous solutions packaged in glass bottles.
	Trastuzumab 440 mg	
010.000.5423.00	Container with a vial with powder and a vial with 20 mL of diluent.	
	INJECTABLE SOLUTION	Subcutaneous.
	Each vial contains: Trastuzumab 600 mg	Dose: 600 mg, every three weeks. The dose application time is approximately 5 minutes.
010.000.6046.00	Package with a vial with 5 mL (600 mg/5 mL)	

Generalities

Trastuzumab binds with high affinity and specificity to subdomain IV, a juxtamembrane region of the extracellular domain of HER2. Trastuzumab binding to HER2 inhibits the ligand-independent HER2 signaling pathway and prevents proteolytic cleavage of its extracellular domain, a mechanism of HER2 activation. As a result, Trastuzumab has been shown, both in in vitro and animal tests, to inhibit the proliferation of human tumor cells that overexpress HER2.

Adverse effects

Cardiac dysfunction, infusion-related reactions, haematotoxicity (particularly neutropenia), infections and pulmonary adverse reactions.

Contraindications and Precautions

Contraindications: Hypersensitivity to the biological.

Precautions: The determination of HER2 must be carried out in a specialized laboratory that can ensure adequate validation of the assessment procedures. Patients treated with trastuzumab have an increased risk of developing CHF or asymptomatic cardiac dysfunction. Herceptin and anthracyclines should not be administered simultaneously in combination for adjuvant treatment. During the post-marketing period, there have been

Serious pulmonary reactions reported with the use of trastuzumab.

Interactions

No formal drug interaction studies have been performed. No clinically significant interactions have been observed between trastuzumab and concomitant medications used in clinical trials.

TRASTUZUMAB EMTANSINE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	HER2 breast cancer	Intravenous infusion.
	Each vial with lyophilized powder contains:	positive unresectable, locally advanced or metastatic breast cancer, who have	Adults: 3.6 mg/kg body weight administered every 21 days
	Trastuzumab emtansine 100 mg	received prior treatment with trastuzumab and a	until disease progression or unacceptable toxicity.
010.000.6017.00	Package with a vial with lyophilized powder with 100 mg (20 mg/mL).	taxane.	
	INJECTABLE SOLUTION		
	Each vial with lyophilized powder contains: Trastuzumab emtansine 160 mg		
	mastazamab emtansine roo mg		
010.000.6018.00	Package with a vial with lyophilized powder with 160 mg (20 mg/mL).		
	і Г	Generalities	1

Trastuzumab emtansine is a HER2-directed antibody-drug conjugate containing the humanized anti-HER2 IgG1 monoclonal antibody trastuzumab, covalently linked to the microtubular inhibitor DM1 (a maytansine derivative) via the stable thioether bond MCC (4-[N -maleimidomethyl]cyclohexane-1-carboxylate).

Emtansine represents the MCC-DM1 complex. Each molecule of trastuzumab is conjugated to an average of 3.5 molecules of DM1.

	С		Risk in Pregnancy
Adverse effects	 effects	Adverse e	

Urinary tract infection, Thrombocytopenia, Anemia, Hypokalemia, Insomnia, Peripheral neuropathy, Headache, Dizziness, Hemorrhage, Epistaxis, Cough, Dyspnea, Rash, Stomatitis, Diarrhea, Vomiting, Nausea, Constipation, Dry mouth, Abdominal pain, Musculoskeletal pain, Arthralgia, Myalgia, Fatigue, Pyrexia, Asthenia, Chills, transaminases elevated

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: It is recommended to permanently discontinue treatment with trastuzumab emtansine if diagnosed Interstitial Lung Disease (ILD) or pneumonitis.

Liver function should be monitored before starting treatment and administering each dose. Patients with an increase in ALT from baseline (e.g. due to liver metastases) may be predisposed to liver injury with an increased risk of a Grade 3-5 hepatic event or increased tested liver function.

Conventional tests (echocardiogram or radionuclide angiography [MUGA]) should be performed to assess cardiac function before starting treatment and at regular intervals (e.g. every three months) during treatment.

In clinical trials, patients were required to have a baseline LVEF ÿ 50%. Patients with a history of congestive heart failure (CHF), serious cardiac arrhythmias requiring treatment, history of myocardial infarction or unstable angina pectoris within 6 months prior to randomization, or current dyspnea at rest due to advanced malignant disease, were excluded from clinical trials. In cases with left ventricular dysfunction, treatment should be delayed or interrupted.

It is recommended to check platelet counts before administering each dose of trastuzumab emtansine. Patients with thrombocytopenia (v 100.000/mm3) and patients receiving anticoagulants (e.g. warfarin, heparin, low molecular weight heparins) should be closely monitored during treatment with trastuzumab emtansine. Trastuzumab emtansine has not been studied in patients with platelet counts ÿ 100,000/mm3 before starting treatment. If Grade 3 or greater platelet count decreases are observed (<

50,000/mm3), trastuzumab emtansine will not be administered until the platelet count is restored to Grade 1 (ÿ 75,000/mm3).

Treatment with trastuzumab emtansine should be temporarily discontinued in patients who develop Grade 3 or 4 peripheral neuropathy until symptoms resolve or regress to Grade ÿ 2. Patients should be monitored clinically on an ongoing basis for signs or symptoms of neurotoxicity.

Interactions

No interaction has been identified to date.

TRFTINOIN

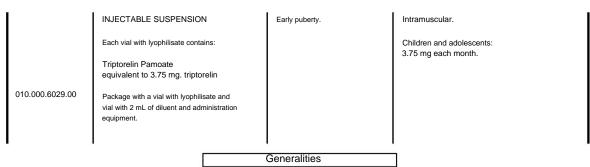

Xeroderr choleste

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Promyelocytic leukemia	Oral.

TRIPTOREL	IN		
Clue	Description	Indications	Route of administration and dosa

It acts at the adenohypophyseal level, stimulating the synthesis and release of the gonadotropins LH (luteinizing hormone) and FSH (follicle-stimulating hormone). The increase in gonadotropin levels causes an increase in the production of testosterone in the testicle or estrogen in the ovary, which in turn inhibit the hypothalamic production of GnRH, through negative feedback, feeding back the hypothalamic-pituitary-gonadal axis.

Abdominal pain, nausea; asthenia, fatigue, erythema, inflammation, pain, reaction (all at the injection site), edema; back pain, musculoskeletal pain, pain in extremities; paresthesia in the lower limbs, dizziness, headache; loss of libido, depression, mood swings; erectile dysfunction; hyperhidrosis; hot flushes. Daily format: ovarian hyperstimulation syndrome, ovarian hypertrophy, pelvic pain; dyspnoea.

Contraindications: Hypersensitivity to the drug, in patients with prostate cancer.

Precautions: Long-term use risk of osteoporosis (patients with additional risk factors for osteoporosis, chronic alcohol abuse, smokers, therapy that reduces bone mineral density, history of osteoporosis, malnutrition). Risk of depression (which can be serious). Men: strict monitoring in the first weeks of treatment, in patients with vertebral metastases, due to risk of spinal cord compression, and in patients with urinary tract obstruction. Evaluate and monitor patients at high risk for metabolic or cardiovascular diseases during androgen deprivation therapy. Monitor prostate specific antigen and plasma testosterone levels. Woman: risk of bleeding. Control of plasma estradiol. Use non-hormonal contraceptive measures. Children: consider treatment in children with progressive brain tumors. Age at start of treatment in girls < 9 years and boys < 10 years. Risk of vaginal bleeding. Exclude pseudo-precocious puberty (gonadal or adrenal tumor or hyperplasia) and gonadotropin-independent precocious puberty (testicular toxicosis, familial Leydig cell hyperplasia).

Interactions

Do not use together with drugs that affect pituitary secretion of gonadotropins.

TROPISETRON
