Update date: February 1, 2024

Group No. 20: Rheumatology and Traumatology

ALLOPURINOL

Clue	Description	Indications	Route of administration and dosage
	TABLET	Primary gout or secondary.	Oral.
	Each tablet contains:		Adults:
	Allopurinol 100 mg	Hyperuricemia.	To prevent attacks: 100 mg/day, increase every 7 days by 100 mg, without exceeding the maximum dose of 800
010.000.2503.00	Package with 20 tablets. Package with 50 tablets.		mg.
010.000.2503.01	Package with 60 tablets.		Drop 200 to 300 mg a day.
	TABLET		Gout with tophi 400 to 600 mg/day.
	Each tablet contains:		Children:
	Allopurinol 300 mg		Hyperuricemia secondary to malignant processes.
010.000.3451.00	Package with 20 tablets.		From 6 to 10 years 300 mg/day in three doses. Children under 6 years: 50 mg three times a day.

Generalities

Reduces the production of uric acid by inhibiting the biochemical reactions that precede its formation.

Risk in P	regnancy		с	
	0			
		Adverse	effects	

Rash, nausea, vomiting, diarrhea, hepatotoxicity, peripheral neuritis, drowsiness, headache, agranulocytosis, aplastic anemia.

Contraindi	cations	and P	recautior	าร
------------	---------	-------	-----------	----

Contraindications: Hypersensitivity to the drug, breastfeeding. Precautions: Cataracts or liver or kidney disease.

Interactions	

Urine acidifiers promote the formation of kidney stones. Alcohol, thiazides and furosemide decrease their anti-gout effect. Xanthines increase serum theophylline. With anticoagulants the anticoagulant effect is potentiated, and with chlorpropamide the hypoglycemic effect. With antineoplastics, the potential to depress bone marrow increases.

COLCHICINE

Description	Indications	Route of administration and dosage
TABLET	Acute attack of gout or	Oral.
	its prevention.	
Each tablet contains:		Adults:
Colchicine 1 mg		Acute phase: 1 mg every one to two hours
		(maximum, 7 mg in 24 hours).
Package with 30 tablets.		
		Chronic phase 1 mg daily.
	TABLET Each tablet contains: Colchicine 1 mg	TABLET Acute attack of gout or its prevention. Colchicine 1 mg

Generalities

It reduces leukocyte mobility, phagocytosis and lactic acid production, reduces the formation of urate crystal deposits and inflammation.

Risk in Pregnancy	d
°	
Advers	o offocts

Aplastic anemia, agranulocytosis and with prolonged use non-thrombocytopenic purpura, peripheral neuritis, shock hematuria, oliguria, depression of the central nervous system, diarrhea, nausea and vomiting.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Γ

Precautions: Liver dysfunction, heart disease, blood dyscrasias, kidney disease, genitourinary disorders, seniors.

Interactions

Alcohol and loop diuretics reduce the effectiveness of colchicine as a prophylactic, with phenylbutazone it can

increase the risk of leukopenia and thrombocytopenia and decreases the absorption of vitamin B12.

Clue	Description	Indications	Route of administration and dosage
	CAPSULE OR DRAGEEE	Inflammatory processes	Oral.
	EXTENDED RELEASE	severe like:	
			Adults:
	Each dragee contains:	Rheumatoid arthritis.	100 mg every 24 hours.
	Diclofenac sodium 100 mg		The maintenance dose must be adjusted to each
	-	Ankylosing	patient.
010.000.3417.00	Container with 20 capsules or dragees.	spondyloarthritis.	
			Maximum dose 200 mg/day.
	INJECTABLE SOLUTION	Spondylarthrosis.	Deep intramuscular.
	Each vial contains:	Osteoarthritis.	Adults:
	Diclofenac sodium 75 mg		One vial of 75 mg every 12 or 24 hours. Do not
			administer for more than two days.
010.000.5501.00	Container with 2 vials with 3 mL.		

Anti-inflammatory, analgesic and antipyretic action due to inhibition of prostaglandin synthesis. It blocks leukocyte migration and alters immunological processes in tissues.

Risk in Pregnancy	b	
A	Adverse effects	
Nausea, vomiting, gastric irritation, diarrhea, dermatitis,	depression, headach	e, vertigo, urinary difficulty, hematuria.
Contraindid	cations and Precautio	ons
Contraindications: Hypersensitivity to the drug, lactation,	, coagulation disorder	s, asthma, peptic ulcer, liver and kidney failure,
gastrointestinal bleeding, cardiovascular disease.		
Recommendations: In the elderly and adults with low bo and liver function.	dy weight. In prolonge	ed treatment, monitor bone marrow, kidney

With acetylsalicylic acid, other NSAIDs, anticoagulants, adverse effects increase. It can increase the toxic effect of lithium methotrexate and digoxin. It inhibits the effect of diuretics and increases their potassium-saving effect. Alters insulin and oral hypoglycemic requirements.

KETOPROFEN

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Mild or moderate pain	Oral.
	Each capsule contains:	rheumatological or traumatic origin.	Adults:
010.000.2504.00	Ketoprofen 100 mg Container with 15 capsules.	Rheumatoid arthritis.	100 to 300 mg divided into three or four doses. Maximum dose 300 mg per day.
		Osteoarthritis.	
I	l	Dysmenorrhea.	
		Generalities	

It produces its anti-inflammatory, analgesic and antipyretic effect possibly by inhibiting the synthesis of prostaglandins.

Risk in Pregnand	cy b
[Adverse effects

Nausea, diarrhea, flatulence, peptic ulcer, anorexia, vomiting, hemorrhages, headache, dizziness, tinnitus, visual disorders, nephrotoxicity.

Contraindications	and Precautions

Hypersensitivity to the drug, acetylsalicylic acid or other NSAIDs, peptic ulcer, liver or kidney dysfunction, coagulation disorders and breastfeeding.

Interactions

With oral anticoagulants the risk of bleeding increases, with acetylsalicylic acid, alcohol or steroids the risk of gastrointestinal side effects may increase.

Clue	Description	Indications	Route of administration and dosage
	ORAL SUSPENSION	Rheumatoid arthritis.	Oral.
	5 1 400 1 1		
	Each 100 mL contains: Meloxicam 0.150 g	Osteoarthritis.	Adults and people over 12 years old: 15 mg every 24 hours.
	Moloxidam 6.100 g	Spondylitis.	
10.000.3421.00	Container with 40 mL and 5 mL		Children:
	dosing pipette. TABLET	Gouty arthritis.	Maximum dose: 0.25 mg/kg body weight/day.
		Acute and chronic	
	Each tablet contains:	non-rheumatic inflammatory conditions.	
	Meloxicam 15 mg	conditions.

ABATACEPT (In Catalog II program)

Risk in Pregnancy c

Headache, dizziness, respiratory tract infections, rhinitis, herpes simplex, cough, urinary tract infections, hypertension, peripheral vasodilation, abdominal pain, dyspepsia, nausea, diarrhea, erythema, fatigue.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Patients with a history of recurrent or chronic infection. Failure to administer concurrently with live vaccines or coadministration of abatacept with immunosuppressive or immunomodulatory biologic agents could potentiate the effects of abatacept on the immune system.

Interactions

Concurrent use with Tumor Necrosis Factor blocking agents is not recommended.

ACEMETHACINE

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Pain and secondary inflammation	Oral.
	Each capsule contains:	to rheumatological	
	Acemetacin 60 mg	conditions:	Adults:
		Acute attack of gout.	60 mg every 8 to 12 hours.
010.000.3405.01	Container with 28 capsules.	Bursitis.	
	RELEASE CAPSULE		Oral.
	PROLONGED	Osteoarthritis.	
			Adults:
	Each extended-release capsule	Post-trauma surgery.	
	contains:		90 mg every 12 to 24 hours.
	Acemetacin 90 mg	Tenosynovitis.	
010.000.3406.00	Package with 14 prolonged release		
	capsules.		
010.000.3406.01	Package with 28 prolonged release		
	capsules.		

Generalities

Dual inhibitor of the cyclooxygenase system, preferentially inhibiting prostaglandins related to pain and inflammation, with little effect on physiological ones, which gives it a profile of great analgesic and anti-inflammatory power, with less renal, gastric and cardiovascular toxicity.

Risk in Pregnancy	с
	Adverse effects

Nausea, vomiting, abdominal pain, diarrhea, loss of appetite.

iea, ioss of appellie.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, last trimester of pregnancy, lactation, acid-peptic disease.

Interactions

Digoxin, lithium salts, anticoagulants, corticosteroids, penicillin, acetylsalicylic acid, furosemide, potassium savers,

probenecid.

hypersensitivity.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, previous treatment with alkylating agents. Precautions: Liver dysfunction, systemic infections.

Interactions

With allopurinol, its biotransformation is inhibited and its adverse effects increase. It can antagonize the neuromuscular blockade produced by pancuronium.

BARICITINIB

Clue	Description	Indications	Route of administration and dosage
	TABLET	Active rheumatoid arthritis	Oral.

	TABLET		years of age and may be appropriate for patients with a
			history of chronic or recurrent infections.
	Each tablet contains:		with
	Baricitinib 4 mg		
			A dose of
010.000.6186.00	Package with 28 tablets.		2 mg once daily for patients who have achieved sustained
			control of disease activity on 4 mg once daily and are
			eligible for dose reduction.
			Atopic dermatitis:
			4 mg once a day.
			4 mg once a day.
			A dose of 2 mg once daily is appropriate for patients who
			maintain sustained control of the disease and in special
			populations (over 75 years of age, with a history of
			chronic or recurrent infections, with creatinine clearance
			between 30 and
			60ml/min.)
I	1	l	I I
		Generalities	

Baricitinib is a selective and reversible inhibitor of Janus kinases (JAK) 1 and JAK. Janus kinases (JAK) are enzymes that transduce intracellular signals from cell surface receptors for various cytokines and growth factors involved in hematopoiesis, inflammation, and immune function. Within the intracellular signaling pathway, JAKs phosphorylate and activate signal transducers and activators of transcription (STATs), which activate gene expression within the cell. Baricitinib modulates these signaling pathways by partially inhibiting the enzymatic activity of JAK1 and JAK2, thereby decreasing the phosphorylation and activation of STATs.

Risk in Pregnancy	с
	Adverse effects

Upper respiratory tract infections, urinary tract infections, gastroenteritis, herpes simplex and shingles.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: Baricitinib should be used with caution in patients with infections, hematologic abnormalities, and malignancies. Combination with biological FARNE or other Janus kinase (JAK) inhibitors is not recommended.

Interactions

The combination with biological DMARDs or other Janus kinase (JAK) inhibitors has not been studied. The use of baricitinib with potent immunosuppressive medicinal products such as azathioprine, tacrolimus or cyclosporine was limited in clinical studies of baricitinib, and a risk of additive immunosuppression cannot be excluded.

BETAMETHASONE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Inflammatory processes	Intramuscular, intravenous or intra-articular.
		serious.	
	Each vial or vial contains:		Adults:
		Immunosuppression.	0.5 to 9 mg/day.
	Betamethasone sodium phosphate		
	5.3 mg equivalent to 4 mg of	Allergic reactions.	Pregnant:
	betamethasone.		Intramuscular: 12 mg 36 to 48 hours before
		Prevention of neonatal	premature delivery.
010.000.2141.00	Container with a vial or a vial with 1 mL.	respiratory distress	
		syndrome.	Children:
			625 µg at 3.75 mg/ m2 body surface area/
			day, administered every 12 hours.

Generalities

It stimulates the transcription of mRNA, with an increase in protein synthesis of enzymes and indirectly blocks phospholipase A2, inhibiting the synthesis of prostaglandins, thromboxanes and leukotrienes.

Gastric irritation, peptic ulcer, euphoria, insomnia, hypokalemia, hyperglycemia, increased susceptibility to infections, osteoporosis, glaucoma, high blood pressure. In children, growth and development can be arrested with chronic use.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, diabetes mellitus, glaucoma, serious infections, gastrointestinal irritation, osteoporosis, high blood pressure, Cushing's syndrome, myasthenia gravis, psychosis, seizures.

Interactions

Its effect decreases with: phenobarbital, phenytoin, rifampicin by increasing its biotransformation. Increases gastrointestinal irritation with non-steroidal antiinflammatory drugs and alcohol. Increases hypokalemia produced by thiazides and furosemide.

CELECOXIB

Clue	Description	Indications	Route of administration and dosage
	CAPSULE	Rheumatoid arthritis.	Oral.
			Adult:
	Each capsule contains:	Postoperative pain.	Addit.
	Celecoxib 100 mg		
		Osteoarthritis.	One or two capsules every 12 or 24 hours.
010.000.5505.00	Container with 20 capsules.		
	CAPSULE		
	Each capsule contains:		
	Celecoxib 200 mg		
	Colocomb 200 mg		
010.000.5506.00	Container with 10 capsules.		
	Container with to capsules.		
	1		

Generalities

Analgesic and non-steroidal anti-inflammatory drug (NSAID) that selectively inhibits the enzyme cyclooxygense-2 (COX-2). It is almost completely absorbed orally, is 97% bound to plasma proteins, is extensively biotransformed in the liver, and inactive metabolites are eliminated in bile (27%) and urine (57%). Less than 3% is excreted in urine. Half-life of 11 hours.

Risk in Pregnancy	С
0	Adverse effects

Abdominal pain, diarrhea, dyspepsia, flatulence, nausea, lower back pain, edema, headache, vertigo, rhinitis, pharyangitis and sinusitis. Melena, hypertension, anemia and allergic reactions occur in less than 2% of patients, and gastrointestinal perforation, hepatitis, arrhythmias and kidney damage occur in less than 0.1%.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug and non-steroidal anti-inflammatory drugs.

Precautions: Use under strict medical supervision and do not exceed the higher recommended doses, especially

in patients with liver failure, heart and kidney failure and a history of acid-peptic disease.

Interactions

Increases the adverse effects of other NSAIDs and anticoagulants. Counteracts the effect of antihypertensives.

CERTOLIZUMAB PEGOL (In Catalog II program)

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Crohn's disease.	Subcutaneous.
		Rheumatoid arthritis with inadequate	Adults:
	Each prefilled syringe contains: Certolizumab pegol 200 mg	response to traditional DMARDs.	Aduits: Crohn's disease:
010.000.5795.00	Package with 2 syringes prefilled with 1 mL.	Axial spondyloarthritis . Psoriasic arthritis .	400 mg initially (given in 2 injections of 200 mg each) and in weeks 2 and 4; subsequently, 400 mg every 4 weeks.
		Treatment of moderate to severe	
		plaque psoriasis in adults who are	Dhaussataid adhaitia
		candidates for systemic therapy.	Rheumatoid arthritis:
			400 mg initially (given in 2 injections of 200 mg each) and in weeks 2 and 4; thereafter, 200 mg every two weeks.
			In combination with methotrexate.
			For maintenance doses, 400 mg every 4 weeks can be considered. In combination with methotrexate.
			Axial spondyloarthritis:
			400 mg (given in 2 subcutaneous injections of 200 mg each) initially and in weeks 2 and 4, thereafter the maintenance dose is 200 mg every two weeks or 400
			mg every 4 weeks.
			Psoriasic arthritis:
			400 mg (given as 2 subcutaneous injections of 200 mg each) initially and at weeks 2 and 4; subsequently 200 mg every two
			weeks.
			For maintenance doses, 400 mg every 4 weeks can be considered.
			Plaque psoriasis: Adults:
			Induction dose:
			The recommended induction dose is
			400 mg (given in 2 subcutaneous injections of 200 mg each) initially (week 0) and in weeks 2 and 4.
			Maintenance dose:
			200 mg every 2 weeks. A dose of 400 mg every 2 weeks may be considered for patients with insufficient response.
			Assess response after 16 weeks of treatment
		Į į	
		Generalities	7

Certolizumab pegol has a high affinity for human TNFÿ to which it binds with a dissociation constant (KD) of 90 pM. TNFÿ is a key pro-inflammatory cytokine that plays a critical role in inflammatory processes. Certolizumab pegol selectively neutralizes TNFÿ (IC90 of 4 ng/mL for *in vitro* inhibition of human TNFÿ in a cytotoxicity assay with murine fibrosarcoma L929 cells) but does not neutralize lymphotoxin ÿ (TNFÿ).

Risk in Pregnancy	b
	Adverse effects

Bacterial and viral infections, eosinophilic disorders, leukopenia including neutropenia, lymphopenia, headaches including migraine, hypertension, nausea, hepatitis including increased liver enzymes, rash,

pyrexia, pain, asthenia, pruritus, injection site reactions.

Contraindications and Precautions

Contraindications: Hypersensitivity to the biological. Active tuberculosis or other serious infections such as sepsis or opportunistic infections. Moderate to severe heart failure.

Precautions: Patients should be closely monitored for signs and symptoms of infections including tuberculosis before, during and after treatment with Certolizumab pegol. Because the elimination

of Certolizumab pegol can take up to 5 months, monitoring should continue throughout this period.

Before starting treatment with Certolizumab pegol., all patients should be evaluated for active or inactive (latent) tuberculosis. This evaluation should include a detailed medical history for patients with a personal history of tuberculosis or possible previous exposure to patients with active tuberculosis and previous and/or current immunosuppressive treatment. Appropriate screening tests should be performed, e.g. tuberculin skin test and chest x-ray, in all patients (applying local recommendations). It is recommended to note the performance of these tests on the patient alert card. Clinicians are reminded of the risk of false negative tuberculin skin testing, especially in patients who are severely ill or immunocompromised.

HBV carriers who require treatment with Certolizumab pegol should be carefully monitored for any signs and/or symptoms of active HBV infection during treatment and for months following completion of treatment.

Patients treated with Certolizumab pegol can be vaccinated, except with live vaccines. No data are available on the response to live vaccines or on secondary transmission of infections by live vaccines in patients receiving Certolizumab pegol. Live vaccines should not be co-administered with Certolizumab pegol.

Interactions

Based on a population pharmacokinetic analysis, concomitant treatment with methotrexate, corticosteroids, non-steroidal antiinflammatory drugs (NSAIDs) and analgesics showed no effects on the pharmacokinetics of certolizumab pegol.

The combination of Certolizumab pegol and anakinra or abatacept is not recommended. Coadministration of Certolizumab pegol with methotrexate had no significant effect on the pharmacokinetics of methotrexate. In a comparison between trials, the pharmacokinetics of certolizumab pegol appeared similar to those previously observed in healthy subjects.

COLLAGEN-POLYVINYLPYRROLIDONE

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Bone consolidation in	Intralesional.
		fractures.	
	Each milliliter contains:		Children, adolescents and adults:
	Collagen-polyvinylpyrrolidone 141.3 mg	Pseudoarthrosis	
	equivalent to 8.33 mg of collagen	and osteoarthrosis.	Fractures: 1.5 mL weekly, for 8
			weeks.
010.000.3999.00	Container with 1.5 mL.		
010.000.3999.01	Container with 4 mL.		Pseudarthrosis: 1.5 mL weekly, during
			10 weeks.
			Osteoarthritis: Intra-articular 1.5 mL
			weekly for 5 weeks.

			Psoriasis
			0.8 mg/kg body weight to a maximum of 50 mg,
			once a week for a maximum of 24 weeks.
	l		
	·	Generalities	

It is a dimeric fusion protein of the human tumor necrosis factor p75 Fc receptor. It inhibits Tumor Necrosis Factor, interrupting the inflammatory cascade characteristic of Rheumatoid Arthritis. In the case of Psoriasis, it inhibits Tumor Necrosis Factor, inhibiting the proliferation of keratinocytes.

Risk in Pregnancy c

Adverse effects

Fever, pruritus, urticaria, thrombositopenia, anemia leukopenia, pancytopenia, seizures, angioedema. Aplastic anemia, erythema, pruritus, pain or swelling at the injection site. Antibody formation.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug, sepsis, infections, blood dyscrasias. Precautions: In patients with: history of previous blood dyscrasias, with pre-existing or recent onset CNS demyelinating disease, with congestive heart failure, history of recurrent or chronic infections. Do not administer live vaccines concurrently with etanercept.

None of clinical importance.

Interactions

ETORICOXIB

Clue	Description	Indications	Route of administration and dosage			
	COMPRESSED	Acute treatment of	Oral.			
		pain in rheumatoid				
	Each tablet contains:	arthritis.	Adults and people over 18 years of age:			
	Etoricoxib 90 mg		90 mg every 24 hours.			
010.000.5699.00	Package with 28 tablets.					
		Generalities				
Oral selective inhibitor of cyclooxygenase-2.						

Risk in Pregnancy c
Adverse effects

Edema/fluid retention; dizziness, headache; palpitations; HTA; gastrointestinal disorders (abdominal pain, flatulence, heartburn), diarrhea, dyspepsia, epigastric discomfort, nausea; ecchymosis; asthenia/fatigue, flu-like syndrome; increased ALT and AST.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Patients with congestive heart failure (NYHA classification II-IV), established ischemic heart disease, peripheral arterial disease and/or cerebral vascular disease (including patients recently undergoing coronary revascularization procedures or angioplasty).

Precautions: Its use is not recommended in patients with advanced kidney disease. Caution should be exercised when initiating use in dehydrated patients, and the possibility of fluid retention, edema, or hypertension should be taken into account when used in patients with preexisting edema, hypertension, or heart failure. It should be used with caution in patients who have previously suffered acute asthmatic attacks, urticaria or rhinitis precipitated by salicylates or non-specific cyclooxygenase inhibitors.

Interactions

Warfarin: Standard monitoring of international normalized ratio prothrombin time values should be performed when treatment is initiated or changed to etoricoxib. Rifampicin: Co-administration of both substances decreased the area under the curve of plasma concentrations of etoricoxib by 65%. Methotrexate: Monitoring for methotrexate-related toxicity should be considered when etoricoxib at doses greater than 90 mg and methotrexate are used concurrently. Diuretics, Angiotensin Converting Enzyme Inhibitors (ACEIs and Angiotensin II Antagonists (AAII): NSAIDs, including selective COX-2 inhibitors, may decrease the antihypertensive effect of diuretics, ACEIs and AAIIs. The combination should be administered with caution, especially in elderly patients Lithium: Non-selective NSAIDs and selective COX-2 inhibitors may increase plasma lithium concentrations Acetylsalicylic acid (ASA): May be used concurrently with low doses of ASA used as cardiovascular prophylaxis. Concomitant administration of low doses of ASA and etoricoxib increases the incidence of gastrointestinal ulcers or other complications. Oral contraceptives: An increased concentration of ethinyl estradiol should be taken into account when choosing an appropriate oral contraceptive for use at the same time. Hormone Replacement Therapy: An increase in estrogen concentration should be taken into account when choosing postmenopausal hormone therapy for simultaneous use.

GOLIMUMAB (In Catalog II program)

			2, and subsequently 100 mg every 4 weeks.
•	-		
Generalities			

Human IgG1k monoclonal antibody produced using a murine hybrid cell line with DNA technology recombinant.

Risk in Pregnancy b
Adverse effects

Upper respiratory tract infections, bacterial and viral infections, anemia, leukopenia and thrombocytopenia, dizziness, paresthesias, hypertension, constipation, alopecia, pyrexia, reaction at the injection site.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Patients with a clinically significant active infection.

Precautions: Infections, active tuberculosis, hepatitis B virus reactivation, congestive heart failure, neurological events. Live viral vaccines should not be administered during use of Golimumab.

Interactions

No specific studies have been carried out.

SODIUM HYALURONATE

1	Clue	Description	Indications	Route of administration and dosage
		INJECTABLE SOLUTION	Adjuvant to treatment of knee	Intra-articular.
		Each prefilled syringe contains:	osteoarthritis.	Adults:
		Sodium hyaluronate 25 mg		25 mg per week for 5 consecutive weeks, this constitutes
				one treatment course.
	010.000.6019.00	Package with a 2.5 mL prefilled syringe.		
			L al	l I
			Generalities	1

Hyaluronic acid is a polysaccharide present in the connective tissue that makes up the joints, such as articular cartilage, the synovial membrane and synovial fluid. Proteoglycans are also a fundamental part of articular cartilage. They bind to hyaluronic acid, forming macromolecular aggregates, which in turn combine with reticular structures of type II collagen, giving rise to the matrix of articular cartilage, which plays an important role in : water retention, resistance to load and joint movement.

Risk in Pregnancy] C

Adverse effects

Pain after application, swelling, urticaria-like rash, pruritus, edema, flushing, sensation of heat, sensation of heaviness at the injection site.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug.

Precautions: The result of the experimental research indicates that no teratogenesis, mutagenesis, or carcinogenesis was evident.

In general it does not present. However, the use of local antiseptics such as chlorhexidine and quaternary ammonium salts including benzalkonium chloride should be avoided as they may cause precipitation of hyalurate.

	Each capsule contains:		
	Indomethacin 25 mg		
010.000.3413.00	Container with 30 capsules.		
		•	

Generalities

It produces its anti-inflammatory, analgesic and antipyretic effect by inhibiting the synthesis of prostaglandins.

	Risk in Pregnancy	B/D in third trimester
	Adverse ef	ffects
Nausea, vomiting, epigastric	pain, diarrhea, headache, vertigo,	hypersensitivity reactions, gastrointestinal bleeding

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug and NSAIDs, breastfeeding, gastrointestinal bleeding, epilepsy, Parkinson's disease, psychiatric disorders, bronchial asthma, children under 14 years of age and anorectal conditions.

Interactions

It increases the toxicity of lithium, reduces the effects of furosemide and increases the effect of anticoagulants and hypoglycemics.

INFLIXIMAB (In Catalog II program)

1	Clue	Description	Indications	Route of administration and dosage
		INJECTABLE SOLUTION	Rheumatoid arthritis with	Intravenous infusion over 2 hours.
		The vial with lyophilisate contains:	inadequate response to traditional DMARDs.	Rheumatoid arthritis: initial dose of 3 mg/Kg,
		Infliximab 100 mg	Psoriasic arthritis.	followed by 3 mg/Kg at 2 and 6 weeks, and then every 8 weeks. In combination with Methotrexate.
	010.000.4508.00	Container with a vial bottle with	Ulcerative colitis.	

freeze-dried and instructive.	Ankylosing spondylitis. Psoriasis.	Ankylosing spondylitis and psoriatic arthritis: 5 mg/kg, followed by 5 mg/kg at 2 and 6 weeks, and then every 8 weeks weeks. Psoriasis: initial dose of 5 mg/Kg, followed by 5 mg/Kg at 2 and 6 weeks, and then every 8 weeks. Ulcerative colitis: initial dose of 5 mg/Kg, followed by 5 mg/Kg at 2 and 6 weeks, and then every 8 weeks. Administer diluted in intravenous solutions packaged in glass bottles.
8-9.5 days.	Generalities actor alpha. It has a volume of distribution Pregnancy b	of 3 L and a half-life of
Abdominal pain, nausea and vomiting an syndrome and worsening heart failure.	Adverse effects e common. Hypersensitivity reactions, fun	 gal and opportunistic infections, lupus
Contraindications: Hypersensitivity to the Precautions: Mild heart failure, active info	Contraindications and Precautions drug, severe congestive heart failure. ection, tuberculosis and seizure disorders.	

Interactions

Corticosteroids increase the volume of distribution.

LEFLUNOMIDE

Description		Route of administration and dosage
COMPRESSED		Oral.
	in adults.	
Each tablet contains:		Adults:
Leflunomide 20 mg		
		Start with a loading dose of 100 mg/day for three days.
0		
COMPRESSED		
		Maintenance dose: 20 mg/day.
Leflunomide 100 mg		
Package with 3 tablets.		
	COMPRESSED Each tablet contains: Leflunomide 20 mg Package with 30 tablets. COMPRESSED Each tablet contains: Leflunomide 100 mg	COMPRESSED Active meumatoid arthritis in adults. Each tablet contains: Leflunomide 20 mg Package with 30 tablets. COMPRESSED Each tablet contains: Leflunomide 100 mg

Generalities

The active metabolite of leflunomide, M1 (A771726), slows the development of the cell cycle of target cells in different phases. M1 inhibits T cell proliferation and DNA synthesis *in vitro* after stimulation by mitogens. It inhibits the mitogen-stimulated proliferation of human peripheral blood mononuclear cells (PBMCs) as well as the proliferation of transformed human and murine cell lines in a dose-dependent manner.

Adverse effects	Risk in Pregnan	:y X
	Γ	Adverse effects

Hepatoxicity, sepsis, immunosuppression, leukopenia, pancytopenia, Stevens-Johnson syndrome.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug and the components of the formula. Severe liver failure. Severe immunodeficiency (HIV/AIDS). Bone marrow dysplasia., Serious or chronic uncontrolled infections. Precautions: Kidney failure, blood dyscrasias, bone marrow suppression.

Interactions

Administration of cholestyramine or activated charcoal reduces plasma concentrations of M1. Vaccination with live vaccines is not recommended. When the administration of a live vaccine is being considered

After stopping treatment with leflunomide, its long half-life must be taken into account.

ORPHENADRINE

Ciue	Description	indications	Route of administration and dosage

SECUKINUMAB

Clue	Description	Indications	Route of administration and dosage
	INJECTABLE SOLUTION	Adult patients active with	Ankylosing spondylitis: 150 mg per
		ankylosing spondylitis inadequate	subcutaneous injection, which is initially
	Each pre-filled pen contains:	response, intolerance, or contraindication	administered at 0 weeks,
	Secukinumab 150 mg	to conventional therapy,	1, 2 and 3 and then from week
			4, on a monthly basis.
010.000.6080.00	Package with two pre-filled pens with 1		
	mL (150 mg/mL).	non-steroidal anti-inflammatory drugs or tumor	
		necrosis factor inhibitors.	

Generalities

Secukinumab is a fully human IgG1 monoclonal antibody that selectively binds and neutralizes the proinflammatory cytokine IL-17A. Secukinmab inhibits the interaction of IL-17A with the IL-17 receptor, which is expressed on various cell types including keratinocytes.

Risk in Pregnancy	b
Adverse effects	

Rhinopharyngitis, Pharyngitis, Rhinitis, Sinusitis, Tonsillitis, Oral herpes, Oral candidiasis, Neutropenia, Conjunctivitis, Diarrhea, Tinea pedis, Otitis externa.

Contraindications and Precautions	

Contraindications: Hypersensitivity to the drug.

Precautions: Infections: Mild to moderate upper respiratory tract such as nasopharyngitis without the need to interrupt treatment. Mucocutaneous infections due to Candida. Crohn's disease: Exacerbations of the disease, in some cases severe, have been observed in patients with active Crohn's disease. Vaccines: Live vaccines should not be administered simultaneously with secukinumab.

Interactions	

Live vaccines should not be administered simultaneously with Secukinumab. The formation of some CYP450 enzymes is suppressed by increased cytokine levels during chronic inflammation. Therefore, a clinically significant effect on CYP450 substrates cannot be excluded as a narrow therapeutic index, where the dose is adjusted individually (e.g. warfarin). Secukinumab has been administered with methotrexate and/or corticosteroids in arthritis studies (including psoriatic arthritis and ankylosing spondylitis) in which no

observed no interaction.

		administered in	
	INJECTABLE SOLUTION	combination with	
		methotrexate.	
	Each vial contains:		
010.000.4516.00	Tocilizumab 200 mg	Systemic juvenile idiopathic	Systemic Juvenile Idiopathic Arthritis (sJIA):
		arthritis (sJIA)	8 mg/kg (patients with a body weight
	Container with vial bottle with 10 mL.	refractory to traditional DMARD	ÿ30 kg) or 12 mg/kg (patients with a
		treatment or in combination	body weight <30 kg), administered every 2 weeks.
		with methotrexate.	2 weeks.
	INJECTABLE SOLUTION		Subcutaneous
	Each prefilled syringe contains:		Adults:
	Tocilizumab 162 mg		162 mg once a week.
	roomzanias rozinig		
010.000.6047.00	Package with 4 prefilled syringes with 0.9 mL		
	each.		
		Generalities	

Generalities

Tocilizumab is a humanized, anti-human monoclonal antibody of the immunoglobulin G1 (IgG1) subclass directed against soluble and membrane interleukin 6 (IL-6) receptors. Tocilizumab specifically binds to both soluble and membrane-bound IL-6 receptors (sIL-6R and mIL-6R), and has been shown to inhibit the signaling cascade mediated by sIL-6R and mIL-6R.

Risk in Pregnancy	x
Adver	se effects

Upper respiratory tract infections, injection site reaction, abdominal pain, gastritis, skin rash, pruritus, urticaria, headache, dizziness, increased levels of hepatic transaminases, hypertension, leukopenia, neutropenia, hypercholesterolemia, cough, dyspnea, conjunctivitis.

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug

Precautions: Tocilizumab treatment should not be initiated in patients with serious active infections and should be discontinued if a patient develops a serious infection. Should be used with caution in patients with

previous history of intestinal ulceration or diverticulitis. An examination to detect latent tuberculosis should be performed prior to starting treatment. Live and attenuated vaccines should not be administered concurrently with Tocilizumab. If an anaphylactic reaction or other severe hypersensitivity reaction occurs, Tocilizumab administration should be stopped immediately and permanently discontinued. It is necessary to evaluate the risk-benefit profile in patients with a history, high risk or demyelinating pathologies. Neutrophils, platelets, and liver transaminases should be monitored and treatment modifications made in case of alteration of normal parameters.

Interdetione	Interactions
--------------	--------------

Medications that are metabolized through CYP450 3A4, 1A2, or 2C9 (e.g., atorvastatin, calcium channel blockers, theophylline, warfarin, phenytoin, cyclosporine, or benzodiazepines) should be monitored as the doses of these products may require be adjusted to maintain their therapeutic effect.

TOFACITINIB

Clue	Description	Indications	Route of administration and dosage
	TABLET	Active rheumatoid arthritis	Oral.
		of moderate to severe intensity	
	Each tablet contains:	refractory to DMARD	Adults:
	Tofacitinib citrate equivalent to	treatment and	5 mg administered twice daily, in combination with
	5 mg tofacitinib	to one or more biological	methotrexate.
		agents. It should be administered in	
010.000.6111.01	Package with 56 tablets.	combination with	
		methotrexate	

Generalities

Tofacitinib is a potent and selective inhibitor of the JAK family of kinases with a high degree of selectivity against other kinases in the human genome. Tofacitinib inhibits JAK1, JAK2, JAK3 and to a lesser extent tyrosine kinase 2. Inhibition of JAK1 and JAK3 by Tofacitinib blocks signaling through receptors that contain the common gamma chain for many cytokines including IL-2, -4, -7, -9, -15 and -21. These cytokines are for the activation, proliferation and function of lymphocytes and the inhibition of their signaling can cause the modulation of multiple aspects of the immune response. Furthermore, inhibition of JAK1 will cause attenuation of signaling by additional pro-inflammatory cytokines, such as IL-6 and type 1 interferons. At higher exposures, inhibition of erythropoietin signaling may occur through inhibition of erythropoietin signaling. by JAK2

Risk in Pregnancy		С
	Advaraa offacta	
	Adverse effects	

Serious upper respiratory tract infections, headache, nasopharyngitis, diarrhea, shingles, and pneumonia

Contraindications and Precautions

Contraindications: Hypersensitivity to the drug. Patent or laboratory evidence of immunodeficiency syndromes, severe active infections, severe liver dysfunction.

Precautions: Tofacitinib should be used with caution in patients who may be at increased risk of gastrointestinal perforation. No dose adjustment is required in patients with mild or moderate renal dysfunction, nor in

patients with mild liver dysfunction. The use of tofacitinib in combination with biological DMARDs should be avoided. selective modulators of co-stimulation and potent immunosuppressants such as azathioprine and cyclosporine.

Internetiene
Interactions

Because tofacitinib is metabolized by CYP3A4, interaction with drugs that inhibit or induce CYP3A4 is likely. Coadministration with Methotrexate (15-25 mg MTX once weekly) had no effect on the pharmacokinetics of Tofacitinib. In patients with rheumatoid arthritis (RA), the oral clearance of Tofacitinib does not vary over time indicating that Tofacitinib does not normalize CYP enzymatic activity in patients with RA. Therefore, coadministration with Tofacitinib is not expected to cause clinically relevant increases in the metabolism of CYP substrates in patients with RA.
